1. INTRODUCTION

The U.S. Environmental Protection Agency (U.S. EPA) tasked the Weston Solutions, Inc. (WESTON[®]), Superfund Technical Assessment and Response Team (START) to assist U.S. EPA On-Scene Coordinators (OSC) Paul Atkociunas, Theresa Holz, and Jacob Hassan in performing a site assessment at the Baycote Metal Finishing Site (the Site) in Mishawaka, St. Joseph County, Indiana (the Site; **Figure 1-1**). Under Technical Direction Document (TDD) No. S05-0001-1111-030, U.S. EPA requested that WESTON START document and photograph current Site conditions; collect liquid and solid waste samples; and evaluate the potential for imminent and substantial threats to the public health or welfare of the United States or the environment posed by Site-related conditions. On December 12 and 13, 2011, WESTON START members Jeff Bryniarski and Jonathan Colomb conducted the site assessment under the direction of OSCs Paul Atkociunas, Theresa Holz, and Jacob Hassan.

This site assessment report is organized into the following sections:

- **Introduction** – Briefly describes the site assessment and its scope
- **Site Background** – Describes the Site and summarizes its known history
- **Site Assessment Activities** – Discusses observations made and sampling methods and procedures used during the site assessment
- **Analytical Results** – Discusses laboratory analytical results for samples collected during the site assessment
- **Threats to Human Health and the Environment** – Identifies Site-related conditions that may warrant a removal action based on criteria established in the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) under Title 40 of the *Code of Federal Regulations* (CFR), Part 300
- **Conclusions** – Summarizes the site assessment findings

2. SITE BACKGROUND

This section discusses the site description and history.

2.1 SITE DESCRIPTION

The Site is located at 1302 Industrial Drive in Mishawaka, St. Joseph County, Indiana (**Figure 1-1**). The coordinates of the Site are 41°39'0.03" North latitude and 86°09'57.11" West longitude. The Site is bordered by industrial properties to the north, east, and south and Industrial Drive and industrial properties to the west (**Figure 2-1**). Residential properties are located approximately 700 feet to the west. The Site contains an asphalt parking area and a large building measuring approximately 250 by 250 feet. The one-story building is constructed of sheet metal and cement blocks.

Seven churches and two schools are located within 1.0 mile of the Site. The St. Joseph River, a major surface water body that terminates in Lake Michigan, is located 0.85 mile northwest of the Site.

2.2 SITE HISTORY

The on-site building is a former electroplating facility that electroplated and anodized steel casings with zinc, cadmium, and chrome for automotive, recreational vehicle, and trailer manufacturers. The facility ceased operations in January 2008, however according to facility records 110,953 gallons of waste remained on site at the time.

On July 10, 2008, the Indiana Department of Environmental Management (IDEM) conducted an inspection of the facility and documented the following violations: failure to conduct waste determinations; failure to conduct weekly inspections; failure to maintain and operate the facility to minimize the possibility of a fire, explosion, or any unplanned sudden or non-sudden release of hazardous waste or hazardous waste constituents; and failure to have a contingency plan.

On October 20, 2009, IDEM and the owner of the Site (TJAC, LLC) entered into an Agreed Order to resolve the violations. The Order stipulated that within 120 days of the Effective Date of the Order, the Respondent was to remove all waste materials and/or product from the facility. The Site began

voluntary removal of on-site wastes; however, the removal was not completed. On February 3, 2010, Site representatives estimated that 50,799 gallons of waste remained on-site.

In a letter dated November 21, 2011, the St. Joseph County Health Department (SJCHD) referred the Site to the U.S. EPA to determine if the Site warrants a time-critical removal action.

On November 21, 2011, the U.S. EPA and SJCHD conducted a site walk-through. During the visit, the OSC documented numerous tanks, drums, containers, and spilled materials on the floor and also observed containers labeled with the following:

- Sulfuric Acid
- Spent Acid
- Acid Rinse
- Copper Solution
- Bromate
- Phosphate
- Nitrate
- Black Chromate
- Tri-Chromate Cobalt
- Yellow Hexavalent Chromate
- Hexavalent Chrome
- Sodium Cyanide

3. SITE ASSESSMENT ACTIVITIES

On December 12 and 13, 2011, U.S. EPA OSCs Paul Atkociunas, Theresa Holz, and Jacob Hassan and WESTON START personnel met at the Site to conduct the site assessment.

The site assessment objectives included the following:

- Identify the constituents or characteristic properties of materials present in drums, vats, small containers, other miscellaneous containers, and building surfaces at the Site
- Determine if a removal action is warranted at the Site based on NCP criteria, and if so, determine if the response should be classified as emergency, time-critical, or non-time-critical response
- Rapidly assess and evaluate the urgency, magnitude, extent, and effects of a release or threatened release of hazardous substances, pollutants, or contaminants identified at the Site

and their potential effects on the public health or welfare of the United States or the environment

- Supply the Agency for Toxic Substances and Disease Registry (ATSDR) or others with information about the nature and magnitude of any health threats associated with the Site
- Support subsequent public health advisories
- Identify a potential response to eliminate, reduce, or control Site-related risks to the public health or welfare of the United States or the environment and to support an Action Memorandum documenting the identified removal approach

Appendix A provides a photographic log of Site conditions during the site assessment. The site reconnaissance and sampling activities are discussed below.

3.1 SITE RECONNAISSANCE

U.S. EPA and WESTON START conducted a site reconnaissance after an initial health and safety briefing. The site reconnaissance was performed in Level D personal protective equipment (PPE) in accordance with the approved site-specific health and safety plan (HASP). Air monitoring was conducted in the breathing zone throughout the site reconnaissance using ToxiRAE instruments to measure hydrogen cyanide (HCN) and ammonia (NH₃), a MultiRAE five-gas meter, and a MicroR gamma radiation detector. The MultiRAE five-gas monitor includes a photoionization detector (PID) that measures organic vapors, a carbon monoxide (CO) sensor, a hydrogen sulfide (H₂S) sensor, a lower explosive limit (LEL) meter, and an oxygen (O₂) meter. No readings exceeded background levels during the site reconnaissance.

The photographic log in **Appendix A** depicts Site conditions at the time of the site assessment. **Figure 3-1** shows the facility layout. Observations made during the site reconnaissance are summarized below.

The building appeared to be in fair condition. The Site was fenced on the north, east, and south sides but not along the west side next to Industrial Drive. Access to the building appeared to be restricted, and all doors and windows had locks. A section of roof in the Wastewater Treatment Room had collapsed, exposing the room and its contents to weather. Water flooded the floor in the Line 4-7 Room. No storm or sanitary sewers or drainage ditches were observed on or around the

Site. Animal prints were observed in material piles on the building floor, indicating the presence of animals at the Site.

During the site assessment, WESTON START conducted a general inventory of drums, vats, totes, buckets, and other miscellaneous containers found in the on-site building. WESTON START observed and documented over 332 drums, vats, totes, and miscellaneous containers. **Table 3-1** summarizes the inventory of containers, along with the existing numbering system (ENS) number used by the facility during the voluntary clean up and potentially hazardous materials observed during the site reconnaissance. The inventory included documenting the approximate sizes, volumes, label information, and contents of containers observed.

Some drums were in poor condition and open and incompatible materials were observed stored next to each other in the Solids Room. Most containers were labeled, but the volumes of the contents were unknown. Many totes were improperly labeled, and several drums were corroded and leaking onto the floor. Evidence of previous spills was noted in the Solids Room and Line 4-7 Room.

3.2 SAMPLING ACTIVITIES

Sampling locations were selected based on observations during the site reconnaissance and chosen to be representative of areas posing potential risk to the public health or welfare of the United States or the environment. The sampling activities were conducted in Level B PPE in accordance with the approved site-specific HASP. Two WESTON START members and two OSCs entered the work zone to conduct sampling activities, while one OSC remained outside the work zone for backup. All sampling teams remained in eyesight throughout the sampling event. Air monitoring was conducted in the breathing zone throughout the sampling activities using ToxiRAE instruments to measure HCN and NH₃ and a MultiRAE five-gas meter. No readings exceeded background levels during the sampling activities.

Figure 3-2 shows the sampling locations. WESTON START collected 11 investigative liquid waste samples and 4 investigative solid waste samples. The samples and sampling locations are described below.

- Sample BMF-WL01-121211 was collected from a vat labeled “Electro Cleaner” with a pH of 10 to 12 standard units (SU) tested using pH paper.
- Sample BMF-WL02-121211 was collected from a vat labeled “Cadmium Plating Solution” with a pH of 10 to 12 SUs tested using pH paper.
- Sample BMF-WL03-121211 was collected from a vat labeled “Phosphate” with a pH of 2 to 4 SUs tested using pH paper.
- Sample BMF-WL04-121211 was collected from a vat labeled “Acid #1” with a pH of 2 to 4 SUs tested using pH paper.
- Sample BMF-WL05-121211 was collected from a vat labeled “ZnCN” with a pH of 10 to 12 SUs tested using pH paper.
- Sample BMF-WL06-121211 was collected from a vat labeled “Black Hexavalent Chromate Postdip.”
- Sample BMF-WL07-121211 was collected from a vat labeled “HCl” with a pH of 2 to 4 SUs tested using pH paper.
- Sample BMF-WL08-121211 was collected from a 5-gallon steel container labeled “Acetone.”
- Sample BMF-WL09-121211 was collected from a cut in half 55-gallon steel drum labeled “Used Oil.”
- Sample BMF-WL10-121211 was collected from a 55-gallon poly drum labeled “Sulfuric Acid” with a pH of 2 to 4 SUs.
- Sample BMF-WL11-121211 was collected from liquid in a flooded portion of the Line 4-8 Room.
- Sample BMF-WS01-121211 was collected from a 55-gallon steel drum labeled “Sodium Cyanide.”
- Sample BMF-WS02-121211 was collected from a 15-gallon steel drum labeled “Chrome Acid Flakes.”
- Sample BMF-WS03-121211 was collected from a pile of dried green material on the floor of the Line 5-6-9 Room.
- Sample BMF-WS04-121211 was collected from pile of yellow material on the floor of the Solids Room.

Fresh sampling gloves were donned before sampling activities began at each new sampling location. All liquid and solid samples were collected as grab samples. The waste liquid samples were collected using glass drum thieves or plastic bailers as appropriate. The waste solid samples were collected using disposable plastic scoops. All sample containers were filled directly from the drum

thieves, bailers, or plastic scoops and labeled with the sample identification number, sampling date, and sampling time. All sampling information was recorded in the Site logbook, and all samples were recorded on the chain-of-custody form. All samples were labeled and immediately placed on ice after collection. The samples were submitted to STAT Analysis Corporation in Chicago, Illinois, under chain of custody for analysis for one or more of the following: corrosivity (pH), ignitability, reactive cyanide, total cyanide, Target Analyte List (TAL) metals, polychlorinated biphenyls (PCB), volatile organic compounds (VOC), semivolatile organic compounds (SVOC), and Toxicity Characteristic Leaching Procedure (TCLP) metals.

4. ANALYTICAL RESULTS

WESTON START collected 11 investigative liquid waste samples and 4 investigative solid waste samples. The samples were collected to assess whether the Site poses imminent and substantial threats to the public health or welfare of the United States or the environment from the presence of potentially hazardous materials. **Figure 3-2** shows the sampling locations. **Tables 4-1** and **4-2** summarize the results for the liquid and solid samples, respectively. Samples BMF-WL08-121211 and BMF-WL09-121211 were liquid waste samples, but because of their density, they were analyzed as solid waste samples. **Appendix B** provides the laboratory analytical report and the data validation report for the samples.

The liquid waste sample laboratory analytical results are summarized below for each sample collected (**Table 4-1**).

- Sample BMF-WL01-121211 (collected from a vat labeled “Electro Cleaner” with a pH of 10 to 12 SUs tested using pH paper)
 - No results meet criteria according to 40 CFR, Part 261.
 - Potassium was detected at a concentration of 20,000 milligram per liter (mg/L) which was the maximum concentration detected.
- Sample BMF-WL02-121211 (collected from a labeled “Cadmium Plating Solution” with a pH of 10 to 12 SUs tested using pH paper)
 - Reactive cyanide and total cyanide were detected at concentrations of 8,000 and 15,000 mg/L, respectively. According to 40 CFR 261.23 (a)(5), this sample represents a cyanide- or sulfide-bearing waste that, when exposed to pH conditions between 2 and

12.5 SUs, could generate toxic gases, vapors, or fumes “in a quantity sufficient to present a danger to human health or the environment.” As noted in the Section 3.1, the open vat from which this sample was collected is located in a room with containers that had pH conditions between 2 and 12.5 SUs. Therefore, this waste sample represents a material that meets the definition of characteristically hazardous waste for cyanide reactivity (D003).

- Cadmium was detected at a concentration of 47,000 mg/L which was the maximum concentration detected.
- Sample BMF-WL03-121211 (collected from a vat labeled “Phosphate” with a pH of 2 to 4 SUs tested using pH paper)
 - No results meet criteria according to 40 CFR, Part 261.
- Sample BMF-WL04-121211 (collected from a vat labeled “Acid #1” with a pH of 2 to 4 SUs tested using pH paper)
 - The corrosivity result showed a pH of less than 2 SUs. According to 40 CFR 261.22(a), this waste sample represents material that meets the definition of characteristically hazardous waste for corrosivity (D002) because the pH value is less than or equal to 2 SUs or greater than or equal to 12.5 SUs.
- Sample BMF-WL05-121211 (collected from a vat labeled “ZnCN” with a pH of 10 to 12 SUs tested using pH paper)
 - Reactive cyanide and total cyanide were detected at concentrations of 140 and 30,000 mg/L, respectively. According to 40 CFR 261.23 (a)(5), this sample represents a cyanide- or sulfide-bearing waste that, when exposed to pH conditions between 2 and 12.5 SUs, could generate toxic gases, vapors, or fumes “in a quantity sufficient to present a danger to human health or the environment.” As noted in the Section 3.1, the open vat from which this sample was collected is located in a room with containers that had pH conditions between 2 and 12.5 SUs. Therefore, this waste sample represents a material that meets the definition of characteristically hazardous waste for cyanide reactivity (D003).
 - Sodium was detected at a concentration of 170,000 mg/L which was the maximum concentration detected.
 - Zinc was detected at a concentration of 130,000 mg/L which was the maximum concentration detected.
- Sample BMF-WL06-121211 (collected from a vat labeled “Black Hexavalent Chromate Postdip”)
 - No results meet criteria according to 40 CFR, Part 261.

- Sample BMF-WL07-121211 (collected from a vat labeled “HCl” with a pH of 2 to 4 SU tested using pH paper)
 - The corrosivity result showed a pH of less than 2 SU. According to 40 CFR 261.22(a), this waste sample represents material that meets the definition of characteristically hazardous waste for corrosivity (D002) because the pH value is less than or equal to 2 SU or greater than or equal to 12.5 SU.
- Sample BMF-WL10-121211 (collected from a 55-gallon poly drum labeled “Sulfuric Acid” with a pH of 2 to 4 SU)
 - The corrosivity result showed a pH of less than 2 SU. According to 40 CFR 261.22(a), this waste sample represents material that meets the definition of characteristically hazardous waste for corrosivity (D002) because the pH value is less than or equal to 2 SU or greater than or equal to 12.5 SU.
- Sample BMF-WL11-121211 (collected from a liquid from a flooded portion of the Line 4-8 Room floor)
 - No results meet criteria according to 40 CFR, Part 261.

The solid waste sample laboratory analytical results are summarized below for each sample collected (**Table 4-2**).

- Sample BMF-WL08-121211 (collected from a 5-gallon steel container labeled “Acetone”)
 - The ignitability result showed a flashpoint of less than 32 degrees Fahrenheit (°F). According to 40 CFR 261.21 (a), this waste sample represents material that meets the definition of characteristically hazardous waste for ignitability (D001) because the flashpoint is below 140 °F.
 - The sample contained 76 percent acetone (760,000 milligram per kilogram [mg/kg]) which indicates that the container was labeled correctly.
- Sample BMF-WL09-121211 (collected from a cut in half 55-gallon poly drum labeled “Used Oil”)
 - No results meet criteria according to 40 CFR, Part 261.
- Sample BMF-WS01-121211 (collected from a 55-gallon steel drum labeled “Sodium Cyanide”)
 - The sample contained TCLP cadmium at 83 mg/L. This TCLP cadmium concentration exceeds the TCLP cadmium regulatory limit of 1.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of characteristically hazardous waste for toxicity (D006).

- Sample BMF-WS02-121211 (collected from a 15-gallon steel drum labeled “Chrome Acid Flakes”)
 - The corrosivity result showed a pH of less than 2 SUs. According to 40 CFR 261.22(a), this waste sample represents material that meets the definition of characteristically hazardous waste for corrosivity (D002) because the pH value is less than or equal to 2 SUs or greater than or equal to 12.5 SUs.
 - The sample contained TCLP chromium at 20,000 mg/L. This TCLP chromium concentration exceeds the TCLP chromium regulatory limit of 5.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of characteristically hazardous waste for toxicity (D007).
 - Chromium was detected at a concentration of 430,000 mg/L which was the maximum concentration detected.
- Sample BMF-WS03-121211 (collected from a pile of dried green material on the floor of the Line 5-6-9 Room)
 - The sample contained TCLP chromium at 420 mg/L. This TCLP chromium concentration exceeds the TCLP chromium regulatory limit of 5.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of characteristically hazardous waste for toxicity (D007).
 - Aluminum was detected at a concentration of 11,000 mg/L which was the maximum concentration detected.
 - Calcium was detected at a concentration of 59,000 mg/L which was the maximum concentration detected.
 - Copper was detected at a concentration of 32,000 mg/L which was the maximum concentration detected.
 - Iron was detected at a concentration of 48,000 mg/L which was the maximum concentration detected.
 - Sodium was detected at a concentration of 14,000 mg/L which was the maximum concentration detected.
- Sample BMF-WS04-121211 (collected from pile of yellow material on the floor of the Solids Room)
 - The sample contained TCLP chromium at 300 mg/L. This TCLP chromium concentration exceeds the TCLP chromium regulatory limit of 5.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of characteristically hazardous waste for toxicity (D007).
- Duplicate sample BMF-WS04-121211-D (duplicate collected from pile of yellow material on the floor of the Solids Room)

- The sample contained TCLP chromium at 380 mg/L. This TCLP chromium concentration exceeds the TCLP chromium regulatory limit of 5.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of characteristically hazardous waste for toxicity (D007).
- Zinc was detected at a concentration of 470,000 mg/L which was the maximum concentration detected.

5. THREATS TO HUMAN HEALTH AND THE ENVIRONMENT

Factors to be considered in determining the appropriateness of a potential removal action at a Site are delineated in the NCP at 40 CFR 300.415(b)(2). A summary of the factors applicable to this Site is presented below.

- **Actual or potential exposure of nearby human populations, animals, or the food chain to hazardous substances, pollutants, or contaminants**

The Site is located in an industrial and residential area. During the site assessment, it was noted that the Site borders industrial properties to the north, east, and south and Industrial Drive and industrial properties to the west. Residential properties are also located nearby, approximately 700 feet to the west. Seven churches and two schools are located within 1.0 mile of the Site. The St. Joseph River, a major surface water body that terminates in Lake Michigan, is located 0.85 mile northwest of the Site.

During the site assessment, it was noted that the Site is fenced on the north, east, and south sides but not along the west side next to Industrial Drive. Access to the building appeared to be restricted, and all doors and windows had locks. A section of roof in the Wastewater Treatment Room had collapsed, exposing the room and its contents to weather. Water flooded the floor in the Line 4-7 Room.

Analytical results from the site assessment indicate that hazardous substances, as defined by CERCLA Part 101(14), pollutants, and contaminants, are present at the Site and represent an actual or potential threat to nearby human populations. These include toxic, ignitable, corrosive, and reactive materials. Analytical results from liquid sample BMF-WL02-121211 documented reactive cyanide and total cyanide at concentrations of 8,000 and 15,000 mg/L, respectively. The analytical results from liquid sample BMF-WL05-121211 documented reactive cyanide and total cyanide at concentrations of 140 to 30,000 mg/L, respectively. Analytical results from solid samples BMF-WS02-121211, BMF-WS03-121211, and BMF-WS04-121211 documented TCLP chromium concentrations of 20,000, 420, and 300 mg/L, respectively. Analytical results from solid sample BMF-WS01-121211 documented TCLP cadmium concentrations of 83 mg/L. Analytical results from liquid samples BMF-WL04-121211, BMF-WL07-121211, BMF-WL10-121211, and solid sample BMF-WS02-121211 documented pH values of less than 2 SU's.

Exposure to small amounts of cyanide can be deadly regardless of the route of exposure. The severity of the harmful effects depends in part on the form of cyanide. Exposure to high levels of cyanide for a short amount of time harms the brain and heart and can even cause coma or death. Cyanide produces toxic effects at levels of 0.05 milligrams of cyanide per deciliter of blood (mg/dL) or higher, and deaths have occurred at levels of 0.3mg/dL and higher. Individuals who have inhaled 546 ppm of hydrogen cyanide have died after a 10-minute exposure; 110 ppm of hydrogen cyanide was life threatening after 1-hour exposure. Ingestion of small amounts of cyanide compounds in a short time may result in death unless antidote therapy is given quickly. Some of the first indications of cyanide poisoning are rapid, deep breathing and shortness of breath, followed by convulsions (seizures) and loss of consciousness. These symptoms can occur rapidly, depending on the amount ingested. The health effects of large amounts of cyanide are similar, whether ingested or inhaled; cyanide uptake into the body through the skin is slower than these other types of exposure. Skin contact with hydrogen cyanide salts can irritate and produce lesions. Workers who inhaled hydrogen cyanide in levels as low as 6-10 ppm over a period of time developed breathing difficulties, chest pain, vomiting, blood changes, headaches, and enlargement of the thyroid gland.

Inhalations of high levels of chromium (VI) can cause irritation to the lining of the nose, nose ulcers, runny nose, and breathing problems such as asthma, cough, shortness of breath, or wheezing. Chromium (VI) is more toxic to humans and therefore causes these effects at much lower concentrations compared to chromium (III). The main health effects as seen in animals following ingestion of chromium (VI) compounds are irritation and ulcers in the stomach and small intestine and anemia. The Department of Health and Human Services, the International Agency for Research on Cancer, and the U.S. EPA have determined that chromium (VI) compounds are known human carcinogens. Inhalation of chromium (VI) has been shown to cause lung cancer in both animals and human. An increase in stomach tumors was observed in humans and animals exposed to chromium (VI) in drinking water.

Breathing high levels of cadmium can severely damage the lungs. Eating food or drinking water with very high levels severely irritates the stomach, leading to vomiting and diarrhea. Long-term exposure to lower levels of cadmium in air, food, or water leads to a buildup of cadmium in the kidneys and possible kidney disease. Other long-term effects include lung damage and fragile bones. A few studies in animals indicate that younger animals absorb more cadmium than adults. Animal studies also indicate that the young are more susceptible than adults to a loss of bone and decreased strength from exposure to cadmium.

Animal prints were observed in material piles on the building floor, indicating the presence of animals at the Site.

Some drums were in poor condition and open, and incompatible materials were observed stored next to each other in the Solids Room. Several drums were corroded and leaking onto the floor. Evidence of previous spills was noted in the Solids Room and Line 4-7 Room. Based on these conditions, nearby populations and the environment could be exposed to potentially hazardous materials if contaminants migrate off site.

- **Hazardous substances, pollutants, or contaminants in drums, barrels, tanks, or other bulk storage containers that may pose a threat of release**

The Site contains over 332 drums, totes, vats, and miscellaneous containers and several spill areas. During the site assessment, some drums were in poor condition and open, and incompatible materials were observed stored next to each other. Several drums were corroded and leaking onto the floor.

Containers identified during the site assessment contain various materials, including the following: zinc cyanide solution, chloride zinc acid, yellow chromate, acid copper bath, black hexavalent chromate postdip, sulfuric acid, hydrochloric acid, and unlabeled and unidentified materials.

A release of materials from the Site is possible because of the potential for trespassing and impacts from stormwater. Trespassers could cause a direct release of contaminants and subsequent dispersion of airborne contamination. During the site assessment, a collapsed roof in the Wastewater Treatment Room and large amounts of standing water on the floor of the Line 4-7 Room were observed. Public areas near the Site could be exposed to potentially hazardous materials if contaminants migrate off site.

Laboratory results documented that sampled materials were characteristic for hazardous waste, including toxic, ignitable, corrosive, and reactive waste streams. Many of the vats, pits, tanks, drums and containers were in deteriorating condition and open to the atmosphere. There is a very high potential of a release of hazardous substances from drums, and other bulk storage containers.

- **Weather conditions that may cause hazardous substances, pollutants, or contaminants to migrate or be released**

Mishawaka receives an average yearly precipitation of 36.59 inches. The average temperatures range from 11 to 86 °F. The Site ground surface is relatively flat. During the site assessment, no storm or sanitary sewers or drainage ditches were observed on or around the Site. A collapsed roof in the Wastewater Treatment Room and large amounts of standing water on the floor of the Line 4-7 Room were observed. In addition, some drums and containers were in poor condition and open, with visible evidence of past spills. Due to the structural condition of the building and presence of containers in poor condition or open, a weather related release or migration of hazardous materials is possible.

- **Threat of fire or explosion**

Analytical results from the site assessment indicate that one sample had a flashpoint of less than 32°F, which meets the definition of a characteristic hazardous waste for ignitability. Therefore, the potential for a fire/explosion exists. Approximately 10,000 people live within 1 mile of the Site. If an event occurs, contaminants could become airborne and may affect the nearby population.

- **The availability of other appropriate federal or state response mechanisms to respond to the release**

In a letter dated November 21, 2011, the SJCHD referred the Site to the U.S. EPA to determine if the Site warrants a time-critical removal action.

6. CONCLUSIONS

During the site assessment, over 332 drums, totes, vats, and miscellaneous containers and several spill areas were observed throughout the Site. Most containers were labeled, but the volumes of the contents were unknown. WESTON START collected 11 investigative liquid waste samples and 4 investigative solid waste samples for analysis for one or more of the following: corrosivity, ignitability, reactive cyanide, total cyanide, TAL metals, PCBs, VOCs, SVOCs, and TCLP metals.

Reactive cyanide and total cyanide were detected at concentrations of 8,000 and 15,000 mg/L, respectively in liquid waste sample BMF-WL02-121211, and 140 and 30,000 mg/L, respectively in liquid waste sample BMF-WL05-121211. According to 40 CFR Part 261, Subpart C, 261.23 (a)(5), this sample represents a cyanide- or sulfide-bearing waste that, when exposed to pH conditions between 2 and 12.5 SUs, could generate toxic gases, vapors, or fumes “in a quantity sufficient to present a danger to human health or the environment.” As noted in the Section 3.1, the open vat from which this sample was collected is located in a room with containers that had pH conditions between 2 and 12.5 SUs. Therefore, this waste sample represents a material that meets the definition of characteristically hazardous waste for cyanide reactivity (D003).

Corrosivity results showed a pH of less than 2 SUs in waste samples BMF-WL04-121211, BMF-WL07-121211, BMF-WL10-121211, and BMF-WS02-121211. According to 40 CFR Part 261, Subpart C, 261.22 (a)(1), this waste sample represents material that meets the definition of characteristically hazardous waste for corrosivity (D002) because the pH value is less than or equal to 2 SUs or greater than or equal to 12.5 SUs.

Ignitability results showed a flashpoint of less than 32 °F in liquid waste sample BMF-WL08-121211. According to 40 CFR Part 261, Subpart C, 261.21 (a)(1), this waste sample represents

material that meets the definition of characteristically hazardous waste for ignitability (D001) because the flashpoint is below 140 °F.

Toxicity results showed TCLP cadmium at 83 mg/L in solid waste sample BMF-WS01-121211. This TCLP cadmium concentration exceeds the TCLP cadmium regulatory limit of 1.0 mg/L. In addition, toxicity results showed TCLP chromium at 20,000 mg/L in solid waste sample BMF-WS02-121211, 420 mg/L in solid waste sample BMF-WS03-121211, 300 mg/L in solid waste sample BMF-WS04-121211, and 380 mg/L in solid waste sample BMF-WS04-121211-D. These TCLP chromium concentrations exceed the TCLP chromium regulatory limit of 5.0 mg/L. Therefore, according to 40 CFR Part 261, Subpart C, 261.24 (b), these samples represent materials that meet the definition of characteristically hazardous waste for toxicity (D008).

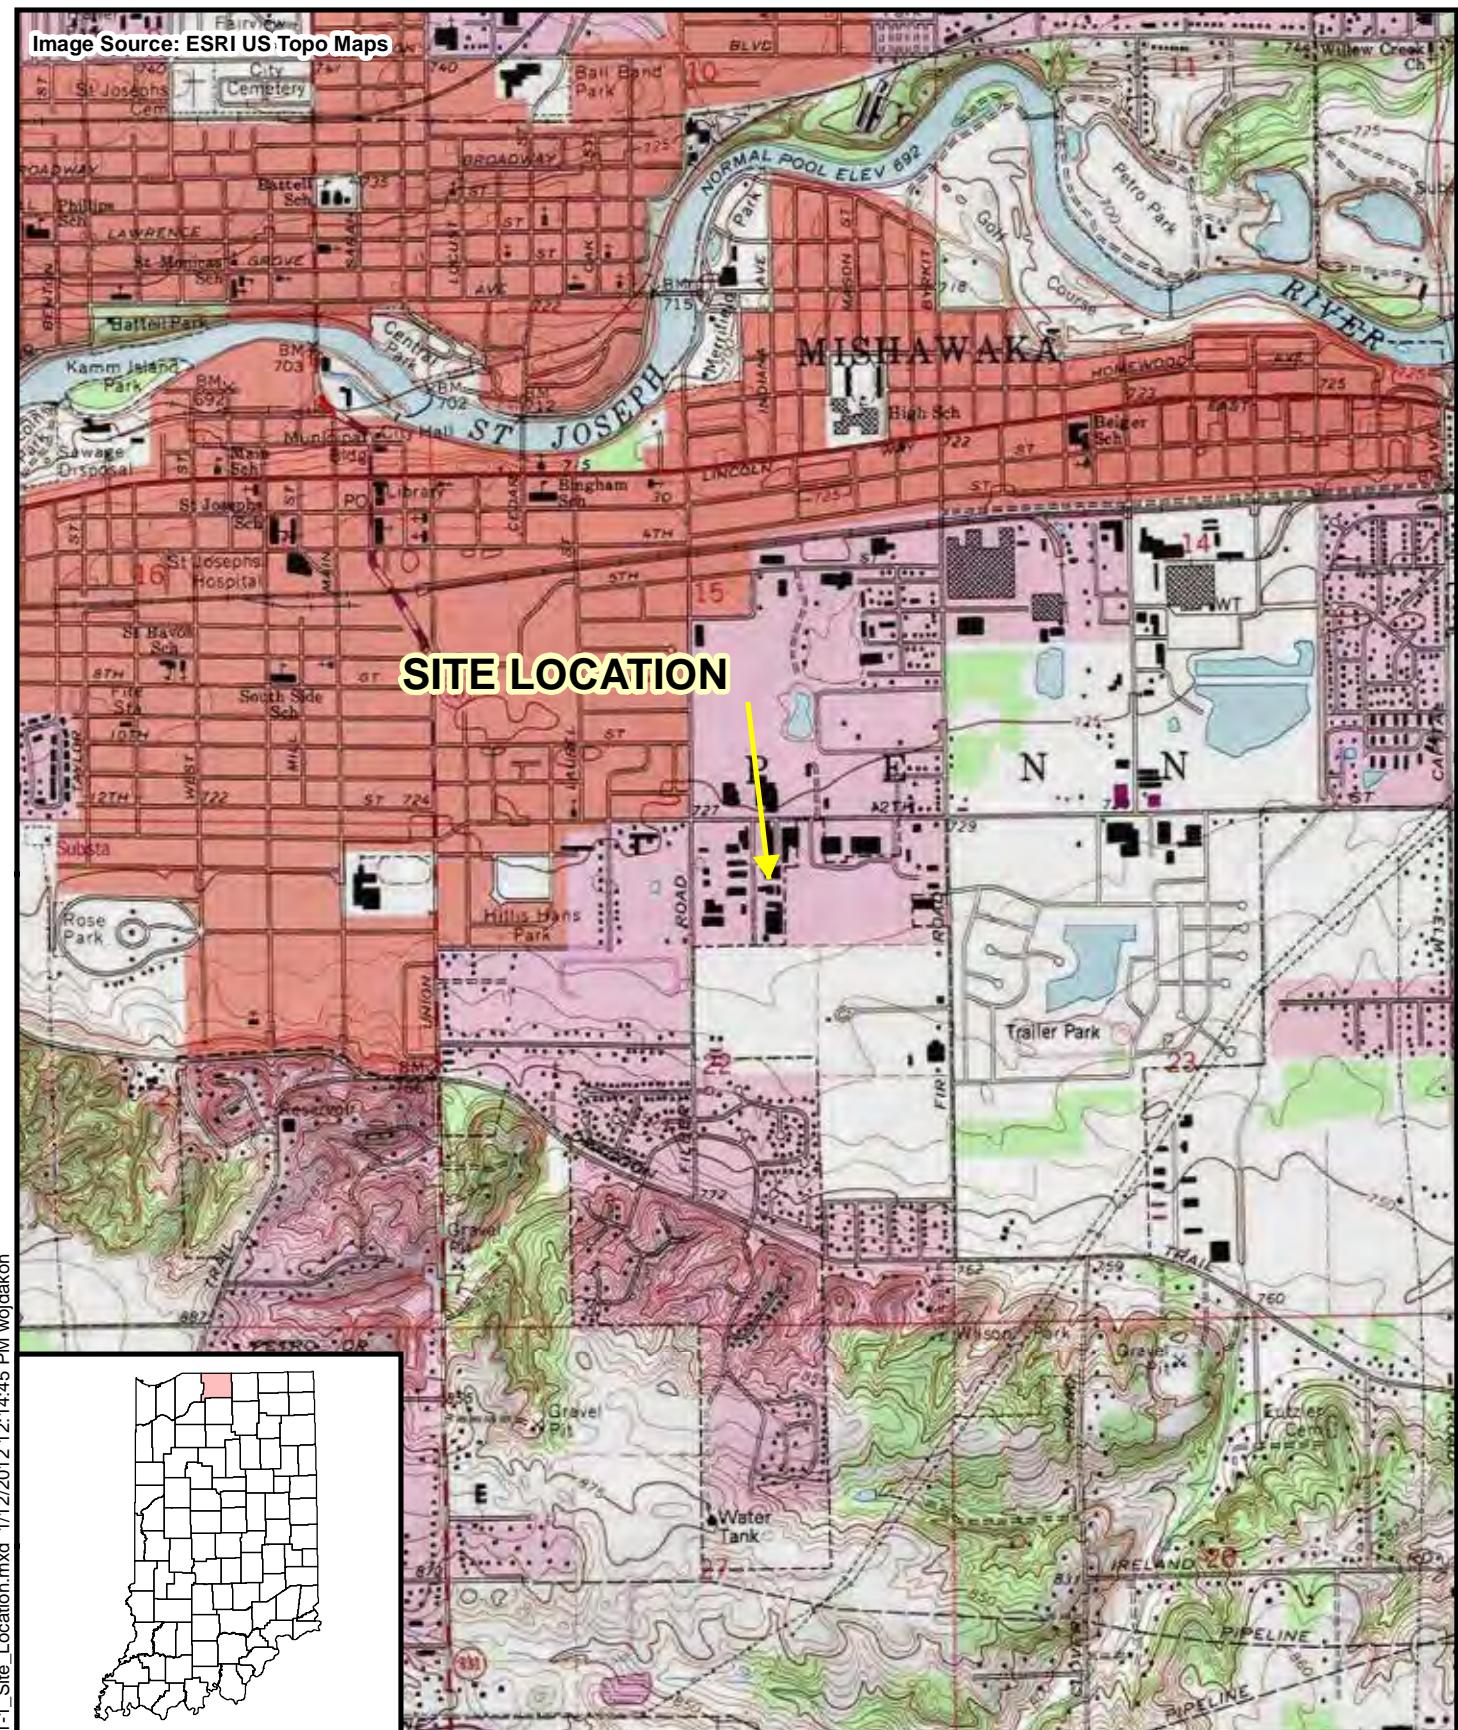

WESTON START determined that wastes present at the Site in drums, vats, totes, and miscellaneous containers pose a potential threat of release and a substantial threat to the public health or welfare of the United States or the environment. Hazards identified at the Site include the following uncontrolled factors:

- Wastes exhibiting the characteristics of ignitability, corrosivity, TCLP cadmium, and TCLP chromium
- Contaminants in open containers in poor condition
- Questionable integrity of building structures (collapsed roof in Wastewater Treatment Room and flooding in Line 4-7 Room)
- Close proximity of Site to residential properties and other sensitive receptors (including churches, schools, and waterways)
- Potential migration pathways from waste inside the on-site building to public areas

Contaminants and conditions at the Site meet criteria established in the NCP for a removal action.

Notes:

Result exceeds 40 CFR screening criterion.

^aF = Degree Fahrenheit

CFR = *Code of Federal Regulations*

ID = Identification

J = Estimated value

mg/L = Milligram per liter

NA = Not analyzed

NL = Not listed

PCB = Polychlorinated biphenyl

SU = Standard unit

SVOC = Semivolatile organic compound

TAL = Target Analyte List

U = Not detected; the associated numerical value is the reporting limit

UJ = Not detected at the estimated associated numerical reporting limit

VOC = Volatile organic compound

a From 40 CFR, Part 261, Subpart C

RE: Baycote Metal Finishing

STAT Project No: 11120395

Dear Lisa Graczyk:

STAT Analysis received 17 samples for the referenced project on 12/13/2011 11:50:00 AM. The analytical results are presented in the following report.

This report is revised to reflect changes made after the initial report was issued.

All analyses were performed in accordance with the requirements of 35 IAC part 186 / NELAC standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 733-0551.

Sincerely,

Catia Giannini
Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory. This analytical report shall become property of the Customer upon payment in full. Otherwise, STAT will be under no obligation to support, defend or discuss the analytical report.

Lab Order: 11120395

CASE NARRATIVE

Total Cyanide was re-distilled and analyzed for samples BMF-WL11-121211 (11120395-011) and BMF-WL11-121211D (11120395-012) as initial results were inconsistent with each other. Subsample that had been retained, allowed TAL Metals analysis for both samples.

Flashpoint was not performed on samples BMF-WL11-121211 (11120395-011) and BMF-WL11-121211D (11120395-012).

Hexavalent Chromium was analyzed 4 hours outside of hold time.

The Hexavalent Chromium Matrix Spike/Matrix Spike Duplicate (MS/MSD) prepared from sample BMF-WL06-121211 (11120395-006) had recovery outside control limits (0.5%/0.5% (MS/MSD) recovery, QC limits 75-125%).

The metals Matrix Spike/Matrix Spike Duplicate (MS/MSD) prepared from sample BMF-WL07-121211 (11120395-007) had the following outside control limits:

Antimony: 139%/138% (MS/MSD) recovery (QC limits 75-125%)

Chromium: 205% (MSD) recovery (QC limits 75-125%)

The MS/MSD had recovery of other analytes outside of control limits, however the analyte concentration in the sample was greater than four times the spike level for those elements.

**BAYCOTE METAL FINISHING
MISHIWAKA, INDIANA
DATA VALIDATION REPORT**

Date: January 4, 2012

Laboratory: STAT Analysis Corporation (STAT), Chicago, Illinois

Laboratory Project #: 11120395

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Analytical Work Order #/TDD #: 20405.016.001.1689.00/S05-0001-1111-031

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for 12 waste liquid and five waste solid samples collected for the Baycote Metal Finishing Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Volatile Organic Compounds (VOC) by SW-846 Method 8260B
- Semivolatile Organic Carbons (SVOC) by SW-846 Method 8270C
- Polychlorinated Biphenyls (PCB) by SW-846 Method 8082
- Metals by SW-846 Methods 6020, 7471A, and 7470A
- Toxicity Characteristic Leaching Procedure (TCLP) Metals by SW-846 Methods 1311, 6020, and 7470A
- Hexavalent Chromium by SW-846 Method 7196A
- Total Cyanide by SW-846 Method 9012A
- Reactive Cyanide by SW-846 Method 7.3.3.2
- Ignitability by SW-846 Method 1010
- Corrosivity by Methods 150.1 and 9045C

A level II data package was requested from STAT. The data validation was conducted in general accordance with the U.S. EPA “Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review” dated June 2008 and “Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review” dated January 2010. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

Data Validation Report
Baycote Metal Finishing Site
STAT Analysis Corporation
Laboratory Project #: 11120395

VOCs by SW-846 METHOD 8260B

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-WL08-121211	11120395-008	Liquid	12/12/2011	12/16/2011
BMF-WL11-121211	11120395-011	Liquid	12/12/2011	12/15/2011
BMF-WL11-121211-D	11120395-012	Liquid	12/12/2011	12/19/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

3. Blanks

Method blanks were analyzed with the VOC analyses. The method blanks were free of target compound contamination above the reporting limit.

Methylene chloride was detected below the reporting limit in one of the blanks but not detected in the samples; therefore, no qualifications were required.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS and LCS duplicate (LCSD) recoveries were within laboratory QC limits. The relative percent differences (RPD) between the LCS and LCSD were within QC limits.

6. Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Results

A site-specific MS and MSD were not analyzed. No qualifications are required.

Data Validation Report
Baycote Metal Finishing Site
STAT Analysis Corporation
Laboratory Project #: 11120395

7. Field Duplicate Results

Sample BMF-WL11-121211-D is a field duplicate of sample BMF-WL11-121211. All results were non-detect in both samples except for acetone. Acetone was detected at 0.31 milligrams per liter (mg/L) in the parent sample and at 0.14 mg/L in the duplicate sample. Although the RPD is somewhat high (75 percent), the difference in results is not that great. There appears to be good correlation between the field duplicate and parent sample.

8. Overall Assessment

The VOC data are acceptable for use based on the information received.

SVOCs BY SW-846 METHOD 8270C

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Prepared	Date Analyzed
BMF-WL08-121211	11120395-008	Liquid	12/12/2011	12/13/2011	12/14/2011
BMF-WL11-121211	11120395-011	Liquid	12/12/2011	12/14/2011	12/14/2011
BMF-WL11-121211-D	11120395-012	Liquid	12/12/2011	12/14/2011	12/16/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection to extraction and 40 days from extraction to analysis.

3. Blanks

Method blanks were analyzed with the SVOC analyses. The method blanks were free of target compound contamination above the reporting limits.

4. Surrogate Results

The surrogate recoveries were within the laboratory-established QC limits.

Data Validation Report
Baycote Metal Finishing Site
STAT Analysis Corporation
Laboratory Project #: 11120395

5. LCS Results

The percent recoveries for the LCS and LCSD results were within the laboratory-established QC limits except for as follows.

In the LCS associated with sample BMF-WL08-121211, 4-Chloro-3-methylphenol was detected slightly below the QC limit. The quantitation limits for 4-Chloro-3-methylphenol in sample BMF-WL08-121211 were flagged "UJ" as estimated for this discrepancy.

The RPDs between the LCS and LCSD were within QC limits.

6. MS and MSD Results

A site-specific MS and MSD were not analyzed. No qualifications are required.

7. Field Duplicate Results

Sample BMF-WL11-121211-D is a field duplicate of sample BMF-WL11-121211. All results were non-detect in both samples except that each sample had a slight detection of a different compound. Bis(2-ethylhexyl) phthalate was detected in the parent sample and diethyl phthalate was detected in the field duplicate. In general, there appears to be good correlation between the field duplicate and parent sample.

8. Overall Assessment

The SVOC data are acceptable for use as qualified based on the information received.

PCBs BY U.S. EPA SW-846 METHOD 8082

1. Samples

The following table summarizes the samples for which this data validation was conducted.

Samples	Lab ID	Matrix	Date Collected	Date Prepared	Date Analyzed
BMF-WL09-121211	11120395-009	Liquid	12/12/2011	12/13/2011	12/20/2011
BMF-WL11-121211	11120395-011	Liquid	12/12/2011	12/14/2011	12/15/2011
BMF-WL11-121211-D	11120395-012	Liquid	12/12/2011	12/14/2011	12/15/2011

Data Validation Report
Baycote Metal Finishing Site
STAT Analysis Corporation
Laboratory Project #: 11120395

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection to extraction and 40 days from extraction to analysis.

3. Blanks

Method blanks were analyzed with the PCB analyses. The method blanks were free of target compound contamination above the reporting limit.

4. Surrogates

The surrogate recoveries were within QC limits.

5. LCS Results

The LCS and LCSD recoveries and RPDs were within the laboratory-established QC limits.

6. MS and MSD Results

A site-specific MS and MSD were not analyzed. No qualifications are required.

7. Field Duplicate Results

Sample BMF-WL11-121211-D is a field duplicate of sample BMF-WL11-121211. Both samples contained no detections of PCBs indicating good correlation between the field duplicate and parent sample.

8. Overall Assessment

The PCB data are acceptable for use based on the information received.

BMF-WS02-121211	11120395-014	Solid	12/12/2011	12/15/2011
BMF-WS03-121211	11120395-015	Solid	12/12/2011	12/15/2011
BMF-WS04-121211	11120395-016	Solid	12/12/2011	12/15/2011
BMF-WS04-121211-D	11120395-017	Solid	12/12/2011	12/15/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 28 days from sample collection to analysis for mercury and 180 days from sample collection to analysis for all other metals.

3. Blank Results

Method blanks were analyzed with the metals analysis. The blanks were free of target analyte contamination above the reporting limits. Some metals were detected below the reporting limits in the method blanks; however, the sample concentrations were either non-detect or much higher than the blank concentrations. No qualifications were required.

4. LCS Results

The LCS recoveries were within the laboratory-established QC limits for target analytes except for as follows.

Data Validation Report
Baycote Metal Finishing Site
STAT Analysis Corporation
Laboratory Project #: 11120395

In the LCS associated with the solid sample analyses, antimony had a percent recovery of 135 percent which is outside the QC limit. Detected antimony results that are associated with this LCS were flagged "J" as estimated.

5. MS and MSD Results

STAT analyzed site-specific MS and MSDs for the metals analysis. The percent recoveries and relative percent difference (RPD) were within QC limits except for as follows.

Some of the metals could not be adequately recovered because the spike amount was much less (more than four times less) than the sample concentrations. No qualifications are required in these instances.

In the MS/MSD using sample BMF-WL07-121211, aluminum had a low percent recovery and antimony had a high percent recovery. In sample BMF-WL07-121211 (sample used for MS/MSD), the quantitation limit for aluminum was flagged "UJ" as estimated. Because antimony was not detected in this sample and the antimony was detected high in the MS/MSD, no qualifications were required for antimony.

6. Field Duplicate Results

Sample BMF-WL11-121211-D is a field duplicate of sample BMF-WL11-121211 and sample BMF-WS04-121211-D is a field duplicate of sample BMF-WS04-121211.

In sample BMF-WL11-121211-D, there were 14 metals detected and 4 of these metals exceeded a standard QC limit of 50 RPD for field duplicates. In sample BMF-WS04-121211-D, there were 17 metals detected and 6 of these metals exceeded a standard QC limit of 50 RPD for field duplicates. Therefore, there appears to be some minor heterogeneity associated with metals in these samples. No qualifications were applied.

7. Overall Assessment

The metals data are acceptable for use as qualified based on the information received.

Laboratory Project #: 11120395

TCLP METALS BY SW-846 METHODS 1311, 6020, AND 7470A

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-WS01-121211	11120395-013	Solid	12/12/2011	12/16/2011
BMF-WS02-121211	11120395-014	Solid	12/12/2011	12/16/2011
BMF-WS03-121211	11120395-015	Solid	12/12/2011	12/16/2011
BMF-WS04-121211	11120395-016	Solid	12/12/2011	12/16/2011
BMF-WS04-121211-D	11120395-017	Solid	12/12/2011	12/16/2011

2. Holding Times

The samples were analyzed within the required holding time limit of 28 days from sample collection to analysis for mercury and 180 days from sample collection to analysis for all other metals.

3. Blank Results

Method blanks were analyzed with the metals analysis. The blanks were free of target analyte contamination above the reporting limits. TCLP mercury was detected in one method blank below the reporting limit. For TCLP mercury, no qualifications were required because the sample results were much greater or non-detect.

4. LCS Results

The LCS recoveries were within the laboratory-established QC limits for target analytes.

5. MS and MSD Results

STAT did not analyze site-specific MS and MSDs. No qualifications are required.

6. Field Duplicate Results

Sample BMF-WS04-121211-D is a field duplicate of sample BMF-WS04-121211. In sample BMF-WS04-121211-D, all detected TCLP metals had high RPD values greater than the standard QC limit of 50 RPD for field duplicates. Therefore, there appears to be heterogeneity associated with TCLP metals in this sample. No qualifications were applied.

Data Validation Report
Baycote Metal Finishing Site
STAT Analysis Corporation
Laboratory Project #: 11120395

7. Overall Assessment

The TCLP metals data are acceptable for use based on the information received.

GENERAL CHEMISTRY PARAMETERS (Hexavalent Chromium by 7196A, Total Cyanide by 9012A, Reactive Cyanide by 7.3.3.2, Ignitability by 1010, and Corrosivity by 150.1 and 9045C)

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed	Parameters Analyzed
BMF-WL01-121211	11120395-001	Liquid	12/12/2011	12/13/2011 – 12/16/2011	pH, ignitability, total and reactive cyanide

BMF-WL10-121211	11120395-010	Liquid	12/12/2011	12/13/2011 – 12/16/2011	pH, ignitability
BMF-WL11-121211	11120395-011	Liquid	12/12/2011	12/13/2011 – 12/21/2011	pH, total and reactive cyanide, hexavalent chromium
BMF-WL11-121211-D	11120395-012	Liquid	12/12/2011		
BMF-WS01-121211	11120395-013	Solid	12/12/2011	12/13/2011 – 12/16/2011	pH, ignitability, total and reactive cyanide
BMF-WS02-121211	11120395-	Solid	12/12/2011	12/13/2011 –	pH, ignitability, total cyanide

Data Validation Report
Baycote Metal Finishing Site
STAT Analysis Corporation
Laboratory Project #: 11120395

Samples	Lab ID	Matrix	Date Collected	Date Analyzed	Parameters Analyzed
	014			12/16/2011	
BMF-WS03-121211	11120395-015	Solid	12/12/2011	12/13/2011 – 12/15/2011	pH, ignitability, total and reactive cyanide
BMF-WS04-121211	11120395-016	Solid	12/12/2011	12/13/2011 – 12/15/2011	pH, ignitability, total cyanide
BMF-WS04-121211-D	11120395-017	Solid	12/12/2011	12/13/2011 – 12/16/2011	pH, ignitability, total cyanide

2. Holding Times

The holding times were acceptable for all analyses.

Note that for hexavalent chromium, the holding time limit for waters is 24 hours and for solid samples is 30 days. The three samples analyzed were waste liquids and not aqueous water samples. The samples were analyzed for hexavalent chromium more than 24 hours from sample collection but within 48 hours of sample collection. This is acceptable. The laboratory flagged hexavalent chromium results with an “H” because they were analyzed past the 24 hour limit for water samples.

3. Method Blanks

Method blanks were analyzed with the total cyanide, reactive cyanide, and hexavalent chromium analyses. The blanks were free of target analyte contamination above the reporting limits. Hexavalent chromium was detected in the method blank below the reporting limit. For hexavalent chromium, no qualifications were required because the sample results were much greater or non-detect.

4. LCS Results

The percent recoveries and RPDs were within QC limits for all LCS and LCSDs analyzed.

5. Laboratory Duplicate Results

Laboratory duplicates were analyzed with the pH analyses. The duplicate RPDs were within QC limits.

Data Validation Report
Baycote Metal Finishing Site
STAT Analysis Corporation
Laboratory Project #: 11120395

6. MS and MSD Results

A site-specific MS and MSD were analyzed with the hexavalent chromium analysis. The percent recoveries were very low. The quantitation limits for the non-detected hexavalent chromium analyses were flagged “UJ” and the detected results were flagged “J” as estimated due to apparent matrix interferences.

7. Field Duplicate Results

Sample BMF-WL11-121211-D is a field duplicate of sample BMF-WL11-121211 and sample BMF-WS04-121211-D is a field duplicate of sample BMF-WS04-121211.

For total cyanide in sample BMF-WL11-121211-D, the RPD was 52 percent which is slightly above the QC limit of 50 RPD. For hexavalent chromium, there was a detect in the field duplicate but not in the parent sample. There appears to be some minor heterogeneity with these two compound. In general, the field duplicate results were acceptable. No qualifications were applied.

8. Overall Assessment

The hexavalent chromium, total cyanide, reactive cyanide, ignitability and pH data are acceptable for use as qualified based on the information received.

Accreditation Numbers: IEPA ELAP 100445; ORELAP IL300001; AIHA 101160; NVLAP LabCode 101202-

Date Reported: December 22, 2011

Date Printed: December 22, 2011

Client:	Weston Solutions	Client Sample ID:	BMF-WS04-121211-D
Lab Order:	11120395	Collection Date:	12/12/2011 2:43:00 PM
Project:	Baycote Metal Finishing	Matrix:	Solid
Lab ID:	11120395-017		

Analyses	Result	RL	Qualifier	Units	DF	Date Analyzed
Flash Point (Open-Cup)	SW1010(M)			Prep Date: 12/13/2011	Analyst: RW	
Flashpoint	No flash up to 212	*		°F	1	12/13/2011
pH (25 °C)	SW9045C			Prep Date: 12/14/2011	Analyst: MNG	
pH	6.9			pH Units	1	12/14/2011
Percent Moisture	D2974			Prep Date: 12/13/2011	Analyst: PBG	
Percent Moisture	29.3	0.2	*	wt%	1	12/14/2011

Qualifiers: ND - Not Detected at the Reporting Limit

J - Analyte detected below quantitation limits

B - Analyte detected in the associated Method Blank

HT - Sample received past holding time

* - Non-accredited parameter

RL - Reporting / Quantitation Limit for the analysis

S - Spike Recovery outside accepted recovery limits

R - RPD outside accepted recovery limits

E - Value above quantitation range

H - Holding time exceeded
