SITE SUMMARY

The Buckbee-Mears (BM) site (CERCLIS ID No. NYN000205908) is a former manufacturer of aperture masks for use in cathode ray tube (CRT) monitors [Ref. 1, p. 1; 2, p. 3; 3, p.5; 4, pp. 59, 110]. The BM facility occupies approximately 50 acres of property in a mixed industrial, commercial, and residential area [Ref. 2, pp. 3, 10; 4, p. 127]. The site is bordered to the north by Kellogg Road; to the east by an agricultural field; and to the south and west by a wooded area. The geographic coordinates of the site are 42.59158° N latitude and 76.15969° W longitude [Ref. 2, p. 3; 5, pp. 1-2; 6, p. 1]. A Site Location Map is presented in Figure 1 [Ref. 7, Figure 1].

The BM facility is owned by International Electron Devices (USA), LLC (hereinafter referred to as 'IED'), which purchased the facility from BMC Industries, Inc. in October 2004 [Ref. 4, pp. 32, 42-43, 128, 130; 8, p. 62]. There were several buildings on site, including a former manufacturing building, a flammable storage building, a hazardous waste storage garage, a waste treatment system containing three clarifiers, and a sludge dewatering unit; an asphalt-paved parking area; and a gravel parking area [Ref. 2, p. 3; 3, pp. 5, 291; 4, p. 31]. The site is surrounded by a gated chain-link fence, and both pedestrian and vehicular access is restricted. In addition, 24-hour security is currently in place with access to the facility through a gate fronting Kellogg Road [Ref. 2, p. 3; 3, p. 5; 7, Figure 2; 9, pp. 3, 4]. The site layout as of early 2007 can be seen in Figure 2 [Ref. 7, Figure 2].

Prior to 1973, the BM site consisted of agricultural land. From approximately 1973 until May 2005, the facility manufactured aperture masks for use in CRT monitors. IED closed the facility in May 2005 due to a lack of funding and abandoned the site [Ref. 2, p. 3; 3, p.5; 4, pp. 32, 42, 59, 110]. Chemicals used during former operations and subsequently abandoned on site included ferric chloride, hydrochloric acid, sodium and potassium hydroxide, anhydrous ammonia, chromic acid, nitric acid, sulfuric acid, chlorine (liquid and gas), and proprietary oxidizing compounds [Ref. 3, p. 5; 4, pp. 3-12]. Process chemicals were stored on site in 18 bulk storage tanks, and were conveyed to the manufacturing process equipment through approximately 350,000 linear feet of chemical feed lines. Wastes generated by on-site manufacturing processes were either treated by the waste treatment system, or were transported off site for disposal [Ref. 2, p. 3]. At the time of active operations at the site, Buckbee-Mears was classified as a Large Quantity Generator (LQG) of hazardous waste under the Resource Conservation and Recovery Act (RCRA) [Ref. 8, pp. 57-61]. Releases of hazardous materials and violations of hazardous waste regulations have been documented at the site [Ref. 4, pp. 17-28, 42-49; 8, pp. 1-63].

In July 2006, the Cortland Police Department (CPD) responded to a report of vandalism and became concerned when they discovered the large amount of chemicals that had been abandoned at the site. The CPD subsequently notified New York Department of Environmental Conservation (NYSDEC) of their findings [Ref. 4, pp. 8, 32]. On July 27, 2006, representatives from NYSDEC, CPD, Cortland Fire Department (CFD), and U.S. Environmental Protection Agency (EPA) conducted a site visit that resulted in the determination of an EPA removal action due to the high potential for a chemical release [Ref. 4, pp. 8-9, 17-28, 32].

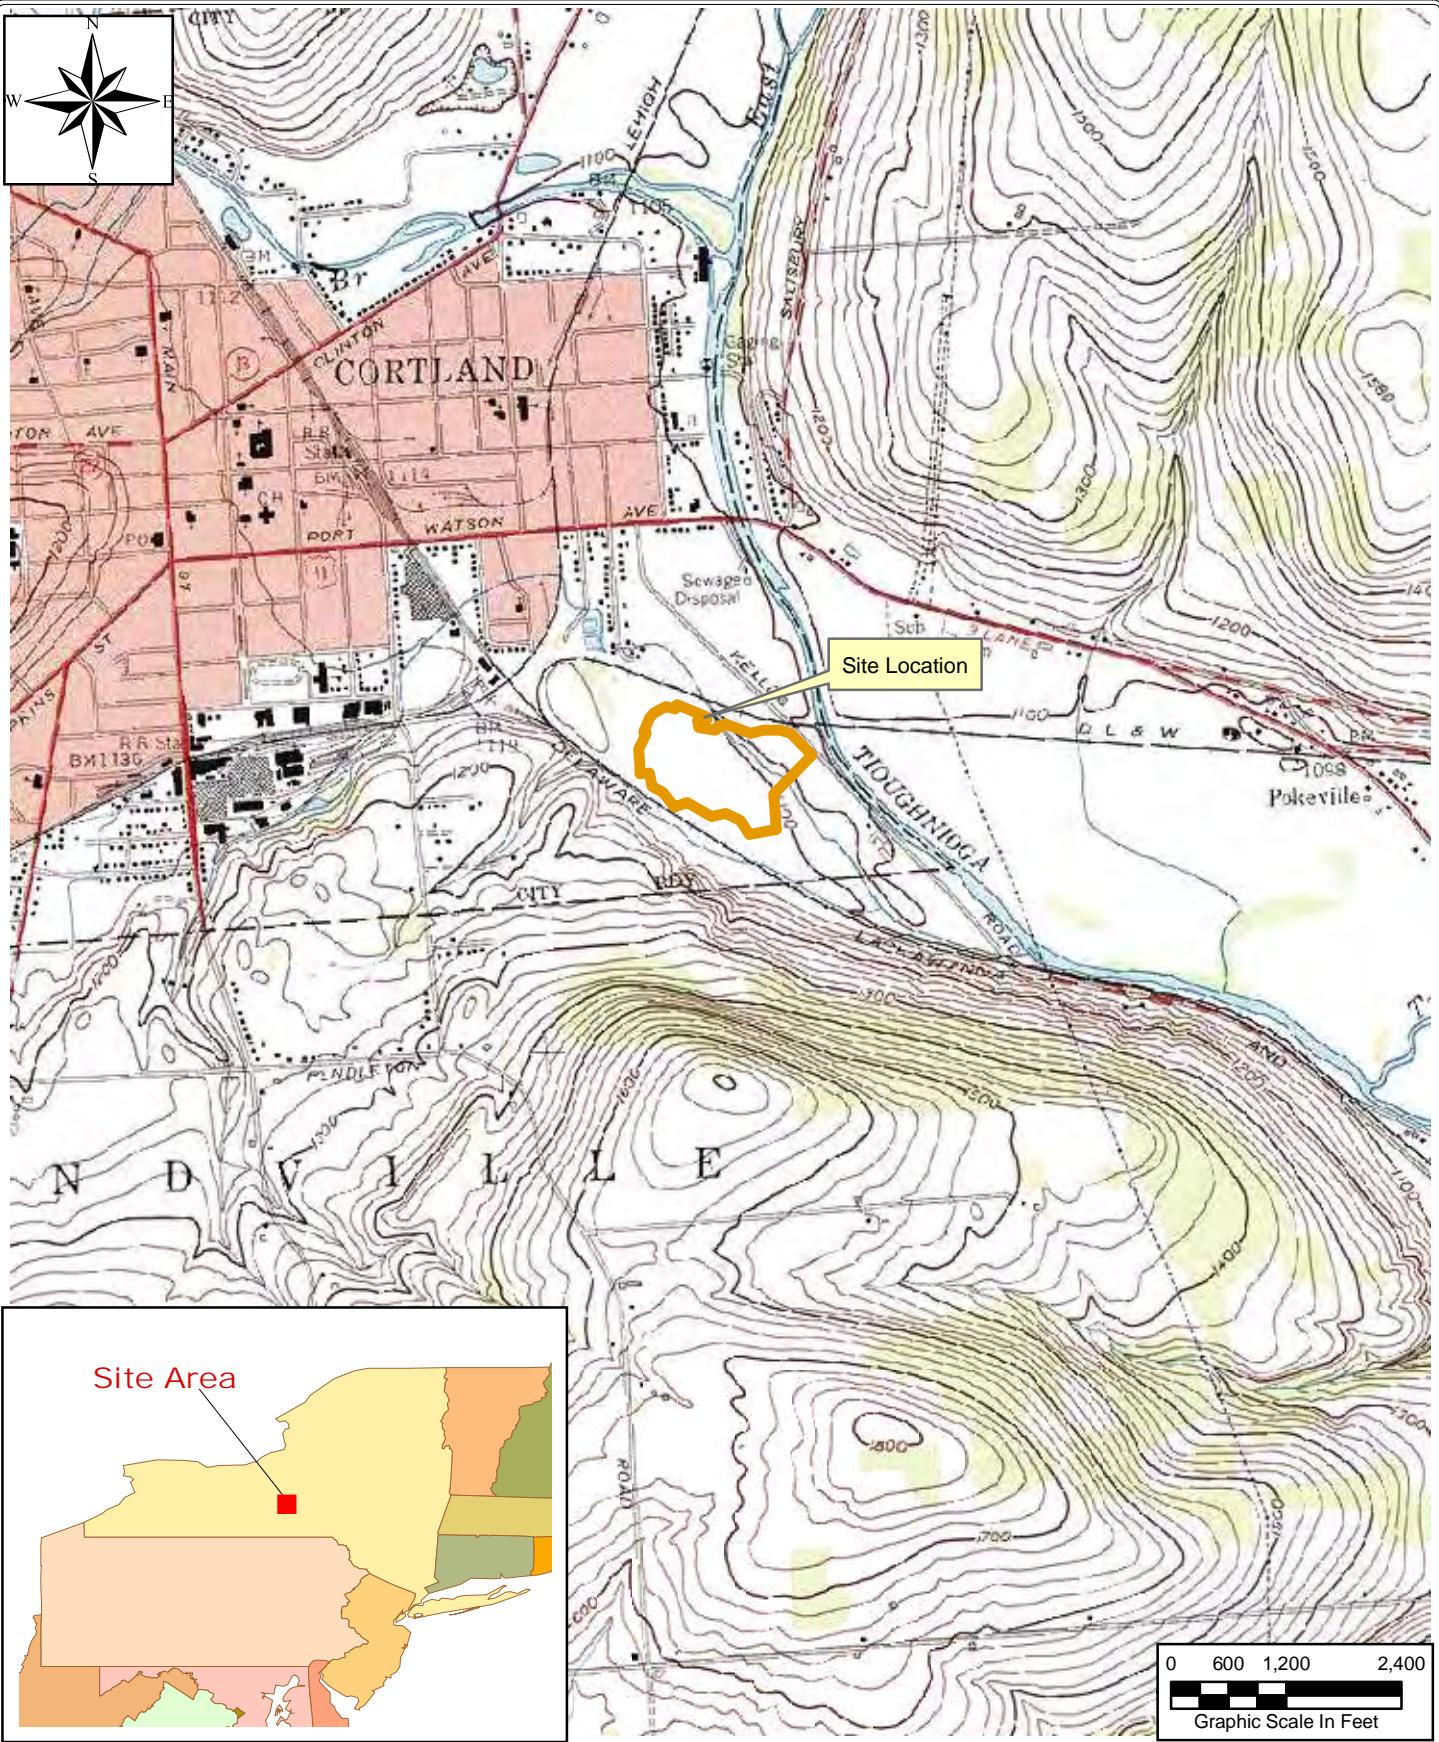

During the July 2006 site visit, numerous hazardous substances were observed to be present in drums, tanks and cylinders throughout the abandoned facility. On August 1, 2006, NYSDEC formally requested that EPA conduct a CERCLA removal action [Ref. 4, pp. 14-15]. In January

2007, EPA initiated a Removal Action at the site. Removal activities conducted to date have included but are not limited to the following: inventory of all on-site chemicals and hazardous wastes, disposal of more than 6,000 containers of chemical wastes, emptying and disposal of 17 of the 18 bulk chemical storage tanks, removal of approximately 153,000 linear feet of chemical feed lines, and demolition of two on-site buildings. Hazardous substances removed from the site have included hydrochloric acid, sulfuric acid, chromic acid, and anhydrous ammonia [Ref. 3, p. 5; 4, pp. 31-35, 121-132; 9, p. 2].

In August 2007, as part of the EPA removal activities, Region 2 Removal Support Team (RST) personnel collected water and sludge samples from several sumps located within the manufacturing buildings. Analytical results of the water samples indicated the presence of chromium, lead, and mercury at concentrations above detection limits. Analytical results of the sludge samples indicated the presence of arsenic and chromium at concentrations above the detection limit. The highest chromium concentrations were detected in samples collected from Building 2, which has since been demolished. In addition, RST personnel collected concrete, solid waste, dust, and wipe samples from the site. Analytical results of the waste, dust, and wipe samples indicated the presence of arsenic, barium, chromium, lead, and mercury at concentrations above detection limits in all media. Chromium concentrations in concrete core samples ranged up to 19,000 milligrams per kilogram (mg/kg) in a sample collected from Room 5-139 in Building 5. RST presented the investigation results to EPA in the "Final Sampling and Analysis Report" dated January 2008 [Ref. 3, pp. 1, 5-24, 291]. EPA encountered mold in Building 5 during the removal action. Workers are required to wear dust masks when entering the building for periods up to 15 minutes, and respirators for periods greater than 15 minutes [Ref. 9, p. 13].

From November 17-20 and December 2-4, 2008, the Region 2 Site Assessment Team 2 (SAT 2) conducted an Integrated Assessment (IA) sampling event at the BM site. SAT 2 installed shallow diameter driven wells (SDDW), and collected surface soil, subsurface soil, ground water, surface water, sediment, and drinking water samples to determine the priority for further action for this site under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). In addition, SAT 2 completed a surface geophysics investigation and wetlands delineation over portions of the site. SAT 2 logged sample locations, well survey information (i.e., location and elevation), and on-site wetland locations electronically using Global Positioning System (GPS) equipment in accordance with the EPA Region 2 GPS Standard Operating Procedures. For surveying the locations and elevations inside Building 5, WESTON integrated the GPS unit with a mechanical total station. Upon completion of the field activities, WESTON performed post-processing and transferred the GPS data to maps using Geographic Information Systems (GIS). Location and elevation data for monitoring wells are presented in Table 1, while location data for boreholes and sediment/surface water samples are presented in Tables 2 and 3, respectively. Ground water contours based on well elevation data and depth-to-water measurements are presented in Figure 2, which also depicts delineated wetlands [Ref. 7, Figure 2; 9, pp. 10-110, 148, 151-155; 10, pp. 2-23; 11, pp. 4-11].

The IA analytical results confirmed that chromium is the primary contaminant of concern at the BM site (see Part III) and indicated that there are observed releases to ground water and surface water (see Parts III and IV).

1. Site Name/Alias Buckbee-Mears

Street 30 Kellogg Road

City Cortland State New York Zip 13045

2. County Cortland County Code 023 Congressional District 25

3. CERCLIS ID NO. NYN000205908

4. Block No. _____ Lot No. _____

5. Latitude 42.59158° N Longitude 76.15970° W

USGS Quad(s) Cortland, NY

6. Approximate size of site 50 acres

7. Owner International Electron Devices (USA), LLC Telephone No. unknown

Street c/o Nationwide Information Services, Inc.
52 James Street, 5th Floor

City Albany State New York Zip 12207

8. Operator N/A Telephone No. _____

Street _____

City _____ State _____ Zip _____

9. Type of Ownership

Private Federal State

County Municipal Unknown Other _____

10. Owner/Operator Notification on File

RCRA 3001 unknown Date _____ CERCLA 103c Date _____

None Unknown

11. Permit Information

<u>Permit</u>	<u>Permit No.</u>	<u>Date Issued</u>	<u>Expiration Date</u>
RCRA LQG	NYD010783967	unknown	unknown
NYS Chemical Bulk Storage	7-000148	unknown	unknown
Air State Facility	7-1102-00006/00079	01/05/2005	01/05/2010

12. Site Status

Active Inactive Unknown

13. Years of Operation: The site was operational from approximately 1973 until 2005.

14. Identify the types of waste sources (e.g., landfill, surface impoundment, piles, stained soil, above- or below-ground tanks or containers, land treatment, etc.) on site. Initiate as many waste unit numbers as needed to identify all waste sources on site.

a) Waste Sources

Waste Unit No.	Waste Source Type	Facility Name for Unit
1	Other	Waste Materials
2	Tanks and containers other than drums	WWTP Clarifiers
3	Contaminated soil	Contaminated Soil

b) Other Areas of Concern

EPA encountered mold in Building 5 during the removal action. Workers are required to wear dust masks when entering the building for periods up to 15 minutes, and respirators for periods greater than 15 minutes.

[Ref. 9, p. 13]

15. Describe the regulatory history of the site, including the scope and objectives of any previous response actions, investigations and litigation by State, Local and Federal agencies (indicate type, affiliation, date of investigations).

- **Air State Facility Permit** – Request by Buckbee-Mears to change the facility name on the Air State Facility Permit, NYSDEC ID #7-1102-00006/00079. Approved by NYSDEC March 24, 2005 [Ref. 4, pp. 63-120].
- **Notice of Violation of Environmental Conservation Law** – Issued by NYSDEC on October 4, 2006. Numerous violations of the Environmental Conservation Law were cited, including improper storage of hazardous materials, failure to properly secure the facility, and failure to remove product and properly close out-of-service aboveground storage tanks (AST) and underground storage tanks (UST). These violations were observed during the inspection of the facility on July 27, 2006 [Ref. 4, pp. 17-29].

- **Notice of Hearing, RCRA Case Number CO 7-20070223-11** – Issued by NYSDEC on February 26, 2007 for violations discovered during the July 27, 2006 facility inspection [Ref. 4, pp. 37-58].
- **Notice of Potential Liability, Demand for Costs, and Request for Information** – Issued on March 2, 2007 by EPA to Buckbee-Mears notifying the Company of their status as a potential responsible party (PRP) and the potential for liability under CERCLA for the costs incurred for response actions taken at the facility [Ref. 4, pp. 59-62].
- **RST Sampling** – From August 10-30, 2007, RST 2 collected ground water samples and sludge samples from recharged slumps located throughout the facility. Concrete samples from the floor and contaminated areas throughout the facility, solid waste samples from throughout the facility, dust samples from the ventilation shafts in Building 1, and wipe samples from stains on the equipment and walls throughout the facility were also collected. All samples were analyzed for RCRA metals [Ref. 3, pp. 5-13, 291].
- **EPA Removal Action** – In January 2007, EPA initiated a Removal Action at the site. Removal activities conducted to date have included but are not limited to the following: inventory of all on-site chemicals and hazardous wastes, disposal of more than 6,000 containers of chemical wastes, emptying and disposal of 17 of the 18 bulk chemical storage tanks, removal of approximately 153,000 linear feet of chemical feed lines, and demolition of two on-site buildings. Hazardous substances removed from the site have included hydrochloric acid, sulfuric acid, chromic acid, and anhydrous ammonia. The Removal Action is ongoing [Ref. 3, p. 5; 4, pp. 31-35, 121-132; 9, p. 2].
- **Preliminary Assessment** – The Buckbee-Mears site was added to the list of CERCLA hazardous waste sites after clean-up activities initiated by the site's former owners failed to secure and stabilize the site. SAT 2 conducted a site reconnaissance in July 2008 and prepared a PA Report in September 2008 to assess current site conditions, to select potential sample locations, and to determine the viability of further action for this site under CERCLA [Ref. 2, pp. 1-10; 9, pp. 2-8].
- **IA Sampling** – From November 17-20 and December 2-4, 2008, SAT 2 conducted Integrated Assessment (IA) sampling at the BM site. SAT 2 installed monitoring wells and collected surface soil, subsurface soil, ground water, surface water, sediment, and drinking water samples to determine the priority for further action for this site under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) [Ref. 9, pp. 10-110; 10, pp. 2-23]. SAT 2 also completed a surface geophysics investigation and wetlands delineation over portions of the site [Ref. 7, Figure 3; 9, pp. 10-18, 148-155; 11, pp. 4-11].

- a) Is the site or any waste source subject to Petroleum Exclusion? Identify petroleum products and by products that justify this decision.

BM is a former manufacturer of aperture masks for use in CRT monitors that utilized several different chemicals including ferric chloride, hydrochloric acid, sodium and potassium hydroxide, anhydrous ammonia, chromic acid, nitric acid, sulfuric acid, chlorine (liquid and gas), and proprietary oxidizing compounds in their manufacturing processes. Neither the site nor any waste source is subject to Petroleum Exclusion provisions.

[Ref. 2, p. 3; 3, p.5; 4, pp. 3-12, 32, 42, 59, 110]

- b) Has normal farming application of pesticides registered under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) occurred at the site? Have pesticides been produced or stored at the site? Have there been any leaks or spills of pesticides on site?

Based on available background information, the site is known to have been used for agricultural purposes prior to construction of the existing facility in 1973. Pesticides regulated under FIFRA are not known to have been applied to the site. Pesticides are not known to have been produced or stored at the site, nor have there been any spills or leaks of pesticides on the site.

[Ref. 2, p. 3; 4, pp. 3-9; 8, pp. 1-63]

- c) Is the site or any waste source subject to Resource Conservation and Recovery Act (RCRA) Subtitle C (briefly explain)?

BM is considered a LQG of hazardous waste under RCRA, ID number NYD010783967. Neither the site nor any waste source is subject to RCRA Subtitle C.

[Ref. 8, pp. 1-63]

- d) Is the site or any waste source maintained under the authority of the Nuclear Regulatory Commission (NRC)?

Neither the site nor any waste source is maintained under the authority of the NRC.

[Ref. 8, pp. 1-63]

16. Do any conditions exist on site which would warrant immediate or emergency action?

EPA has been conducting a Removal Action at the site since January 2007.

[Ref. 4, pp. 31-32; 9, pp. 2-6]

PART II: WASTE SOURCE INFORMATION

For each of the waste units identified in Part I, complete the following items.

Waste Unit 1 - Waste Materials (sludge, water, building materials)

Source Type

<input type="checkbox"/> Landfill	<input type="checkbox"/> Contaminated Soil
<input type="checkbox"/> Surface Impoundment	<input type="checkbox"/> Pile
<input type="checkbox"/> Drums	<input type="checkbox"/> Land Treatment
<input type="checkbox"/> Tanks/Containers	<input checked="" type="checkbox"/> X Other

Description:

1. Describe the types of containers, impoundments, or other storage systems (i.e., concrete - lined surface impoundments) and any labels that may be present.

In August 2007, as part of the EPA removal activities, Region 2 RST personnel collected water and sludge samples from several sumps located within the manufacturing buildings. Analytical results of the water samples indicated the presence of chromium, lead, and mercury at concentrations above detection limits. Analytical results of the sludge samples indicated the presence of arsenic and chromium at concentrations above the detection limit. The highest chromium concentrations were detected in samples collected from Building 2, which has since been demolished. In addition, RST personnel collected concrete, solid waste, dust, and wipe samples from the site. Analytical results of the waste, dust, and wipe samples indicated the presence of arsenic, barium, chromium, lead, and mercury at concentrations above detection limits in all media. Chromium concentrations in concrete core samples ranged up to 19,000 parts per million (ppm) in a sample collected from Room 5-139 in Building 5.

[Ref. 3, pp. 5-24, 291]

2. Describe the physical condition of the containers or storage systems (i.e., rusted and/or bulging drums).

Buildings 1 and 2 have been demolished, but the building slabs and some debris from the demolition currently remain on site. Building 5 remains on the site.

[Ref. 3, p. 5; 4, pp. 31-35, 121-132; 9, p. 2]

3. Describe any secondary containment that may be present (e.g., drums on concrete pad in building or aboveground tank surrounded by berm).

In January 2007, EPA initiated a Removal Action at the site. Removal activities conducted to date have included but are not limited to the following: inventory of all on-site chemicals and hazardous wastes, disposal of more than 6,000 containers of chemical wastes, emptying and disposal of 17 of the 18 bulk chemical storage tanks, removal of approximately 153,000 linear feet of chemical feed lines, and demolition of two on-site buildings. Hazardous substances removed from the site have included hydrochloric acid, sulfuric acid, chromic acid, and anhydrous ammonia.

[Ref. 3, p. 5; 4, pp. 31-35, 121-132; 9, p. 2]

Hazardous Waste Quantity

The majority of the waste materials have been removed from the site through EPA removal activities, but an undetermined quantity remains behind.

[Ref. 3, p. 5; 4, pp. 31-35, 121-132; 9, p. 2]

Hazardous Substances/Physical State

The following site-related hazardous substances were detected in waste samples at the BM site:

- Chromium
- Lead
- Mercury
- Arsenic
- Barium

The physical states associated with this source are solid and liquid.

[Ref. 3, pp. 5-24, 291]

PART II: WASTE SOURCE INFORMATION

For each of the waste units identified in Part I, complete the following items.

Waste Unit 2 - WWTP Clarifier Tanks

Source Type

<u>Landfill</u>	<u>Contaminated Soil</u>
<u>Surface Impoundment</u>	<u>Pile</u>
<u>Drums</u>	<u>Land Treatment</u>
<u>X Tanks/Containers</u>	<u>Other</u>

Description:

1. Describe the types of containers, impoundments, or other storage systems (i.e., concrete - lined surface impoundments) and any labels that may be present.

The BM facility operated an on-site wastewater pretreatment plant (WWTP), which received aperture mask process wastewater and non-process wastewaters. Following pH adjustment in neutralization tanks, most solids were removed from the wastewaters through flocculation and gravitational settling in the open-top, concrete clarifier tanks. The treated wastewater was discharged to the City of Cortland Publicly Owned Treatment Works (POTW) and was subject to standards limiting the concentrations of specific pollutants that can be discharged to a POTW. The available documentation provided wastestream data for the period from 1990 to 2003 and indicated that chromium, lead, arsenic, and cadmium were contained in the wastestream.

[Ref. 2, p. 3; 3, p. 291; 7, Figures 2-3; 9, pp. 6, 134; 30, pp. 2-3; 31, pp. 4-8]

2. Describe the physical condition of the containers or storage systems (i.e., rusted and/or bulging drums).

The clarifier consists of open-top, concrete tanks. According to a 1994 NYSDEC inspection, a thick floating sludge blanket washed over the clarifier tank at times, causing an effluent chromium violation.

[Ref. 2, p. 3; 3, p. 291; 7, Figures 2-3; 9, pp. 6, 134; 30, pp. 2-3, 75, 82, 88-89, 138]

3. Describe any secondary containment that may be present (e.g., drums on concrete pad in building or aboveground tank surrounded by berm).

Based on a 1994 inspection, NYSDEC indicated that a thick floating sludge blanket washed over the clarifier tank at times, causing an effluent chromium violation. There is no secondary containment associated with the clarifier tanks.

[Ref. 7, Figure 3; 9, pp. 6, 28, 134, 159; 30, pp. 2-3, 75, 82, 88-89, 138]

Hazardous Waste Quantity

Buckbee-Mears reported that 6,355,612 tons (12,711,224,000 pounds) of hazardous wastewater passed through the WWTP from 1990 to 2003. This mass (W) is divided by 5,000 to assign the value of 2,455,545 for hazardous wastestream quantity.

[Ref. 19, pp. 51590-51591; 31, p. 4]

Hazardous Substances/Physical State

The following hazardous substances are associated with the WWTP:

- Chromium
- Lead
- Arsenic
- Cadmium

The physical state associated with this source is liquid.

[Ref. 31, pp. 4-8]

PART II: WASTE SOURCE INFORMATION

For each of the waste units identified in Part I, complete the following items.

Waste Unit	<u>3</u>	-	<u>Contaminated Soil</u>
Source Type			
Landfill		<input checked="" type="checkbox"/>	Contaminated Soil
Surface Impoundment			Pile
Drums			Land Treatment
Tanks/Containers			Other

Description:

1. Describe the types of containers, impoundments, or other storage systems (i.e., concrete - lined surface impoundments) and any labels that may be present.

The IA analytical results show that chromium and mercury are present in soil at the BM site. Chromium was detected significantly above background (13.2 J and 13.7 J milligrams per kilogram [mg/kg] in samples BM-S01 and BM-SS01, respectively; J = estimated) in thirteen surface soil samples and one subsurface soil sample. The highest chromium concentrations were detected in surface samples BM-S14 (10,900 mg/kg), BM-S04 (5,250 J mg/kg), and BM-S13 (3,430 mg/kg), which were all collected directly beneath the slab of former Building 1. Mercury was detected significantly above background (0.024 U mg/kg in sample BM-SS01; U = not detected) in subsurface sample BM-SS24 (0.10 mg/kg).

The contaminated soil mostly lies beneath the former manufacturing areas in Building 5 and former Building 1, indicating that the apparent source of soil contaminants is the historical manufacturing operations.

[Ref. 7, Figure 3; 14, pp. 40, 43, 45, 60, 62, 71, 74-75, 78, 110-113, 115, 131, 136, 142]

2. Describe the physical condition of the containers or storage systems (i.e., rusted and/or bulging drums).

There is no containment of the contaminated soil at the BM site, as evidenced by the IA boring logs that show no liner throughout the site. The areas where contaminated soil was encountered are mostly covered by impermeable materials such as asphalt or concrete.

[Ref. 7, Figure 3; 9, pp. 33-95]

3. Describe any secondary containment that may be present (e.g., drums on concrete pad in building or aboveground tank surrounded by berm).

As stated above, there is no liner in the areas where soil contaminants were detected. Secondary containment is not applicable to the evaluation of contaminated soil.

[Ref. 7, Figure 3; 9, pp. 33-95; 19, pp. 51596-51597]

Hazardous Waste Quantity

The area of contaminated soil has not been fully delineated. Therefore, the hazardous waste quantity is an unknown area greater than zero square feet.

[Tables 16-17; Ref. 7, Figure 3; Ref. 19, pp. 51590-51591]

Hazardous Substances/Physical State

The following site-related hazardous substances were detected in soil samples at the BM site:

- Chromium
- Mercury

The physical state associated with this source is solid.

[Ref. 14, pp. 40, 43, 45, 60, 62, 71, 74-75, 78, 110-113, 115, 131, 136, 142]

PART III. SAMPLING RESULTS

EXISTING ANALYTICAL DATA

August 2007 – From August 10-30, 2007, RST personnel collected water and sludge samples from several sumps located within the manufacturing buildings. All samples were analyzed for RCRA metals. Analytical results of the water samples indicated the presence of chromium, lead, and mercury at concentrations above detection limits. Analytical results of the sludge samples indicated the presence of arsenic and chromium at concentrations above the detection limit. The highest chromium concentrations were detected in samples collected from Building 2, which has since been demolished. In addition, RST personnel collected concrete, solid waste, dust, and wipe samples from the site for RCRA metals analysis. Analytical results of the waste, dust, and wipe samples indicated the presence of arsenic, barium, chromium, lead, and mercury at concentrations above detection limits in all media. Chromium concentrations in concrete core samples ranged up to 19,000 mg/kg in a sample collected from Room 5-139 in Building 5.

[Ref. 3, pp. 5-24, 291]

INTEGRATED ASSESSMENT SAMPLING RESULTS

From November 17-20 and December 2-4, 2008, SAT 2 personnel conducted a sampling event at the BM site. SAT 2 collected surface soil, subsurface soil, ground water, surface water, sediment, and drinking water samples to determine the priority for further action for this site under CERCLA. A total of 33 surface soil (including one duplicate sample), 33 subsurface soil (including two duplicate samples), 14 ground water (including one duplicate sample), 10 surface water (including one duplicate sample), 15 sediment (including one duplicate sample), and 3 drinking water samples (including one duplicate sample) were collected from the site.

The samples collected by SAT 2 from the BM site were analyzed for Target Compound List (TCL) Organics (volatile organic compounds [VOC], semivolatile organic compounds [SVOC], pesticides, and Aroclors [i.e., PCBs]) through the EPA Contract Laboratory Program (CLP). The solid samples and rinsate blank BM-RIN01 (soil sampling equipment) were analyzed for Target Analyte List (TAL) Inorganics (including mercury and cyanide) through CLP. All other aqueous samples were analyzed for TAL Inorganics (including mercury and cyanide), Hexavalent Chromium, and Dissolved TAL Inorganics at the EPA Region 2 DESA laboratory. The sample portion designated for Dissolved TAL Inorganics analysis had been field-filtered through a 0.45-micron filter by the sampling team. Sediment samples were analyzed for Grain-Size Distribution and Total Organic Carbon (TOC) at the EPA Region 2 DESA laboratory.

Soil sample collection began with retrieval of continuous soil cores from soil borings advanced to a maximum depth of 15 feet using direct-push technology. SAT 2 then used dedicated, disposable En Core® sampling devices, plastic scoops, and aluminum trays to collect soil samples for lab analysis from the soil cores. Surface soil samples were collected from the 0- to 2-foot interval as measured from the top of the soil column at each borehole, and subsurface soil samples were collected from 2-foot intervals where visual observations suggested potential contamination, or at the 2-foot interval

just above the saturated zone as displayed in the soil core. SAT 2 was unable to collect subsurface soil sample BM-SS14 due to equipment refusal at 2 feet below grade.

Upon completion of soil retrieval at 11 locations, SAT 2 installed small-diameter driven wells (SDDW) in the boreholes, and developed the wells with a peristaltic pump. SAT 2 collected ground water samples from the monitoring wells in accordance with EPA Region 2's Ground Water Sampling Procedure, Low Stress (Low Flow) Purging and Sampling dated March 1998. Wells were purged using a bladder pump with dedicated, disposable bladders and sample tubing. During well purging, the following field indicator parameters were measured with in-line analyzers and recorded periodically: depth-to-water, flow rate, pH, temperature, dissolved oxygen (DO), conductivity, and turbidity. Wells were purged until turbidity fell below 50 NTU and indicator parameters stabilized for three consecutive readings, or for at least 4 hours if turbidity exceeded 50 NTU. After collection of VOC sample fractions, the dedicated, disposable sample tubing was connected to a peristaltic pump for faster collection of other sample fractions. The bladder pumps were decontaminated before and after sampling events, as well as between well sampling locations. In addition to the ground water samples from the SDDWs, SAT 2 collected water samples from two open wells near the wastewater treatment plant clarifier. These grab samples were collected with dedicated, disposable bailers.

SAT 2 collected surface water samples directly into the required containers, without the use of sampling devices, by submerging the bottle. At each specific location where both surface water and sediment samples were collected, surface water samples were collected prior to sediment samples. SAT 2 used dedicated, disposable En Core® sampling devices, plastic scoops, and aluminum trays to collect sediment samples at depths of 0 to 3 inches, allowing any excess surface water to drain from the sampling device. All remaining sediment, not used for laboratory analysis, was discarded at the sampling location. SAT 2 performed sediment and surface water sampling activities in a downstream-to-upstream direction.

SAT 2 collected drinking water samples from sampling spigots directly into the proper sampling bottles. The sampling spigots were chosen to reflect raw well water prior to treatment or filtration. The spigots were allowed to run for 15 minutes prior to sampling.

[Ref. 9, pp. 10-111, 139-161; 10, pp. 1-91]

The organic analytical results indicated that organic contaminants are not a concern at the BM site. The only VOC detected above sample quantitation limits (SQL) in surface soil samples was methylene chloride in samples BM-S07 (5.8 micrograms per kilogram [$\mu\text{g}/\text{kg}$] and BM-S26 (5.2 $\mu\text{g}/\text{kg}$). The only VOCs detected above SQLs in on-site subsurface soil samples were acetone (320 $\mu\text{g}/\text{kg}$) and 2-butanone (34 $\mu\text{g}/\text{kg}$) in sample BM-SS24. Methylene chloride, acetone, and 2-butanone are common lab chemicals that are not known to be associated with site operations. In addition, 1,1,1-trichloroethane (TCA) was detected in background sample BM-SS01 (10 $\mu\text{g}/\text{kg}$). The only VOC detected in ground water samples was 1,1,1-TCA in background sample BM-GW01 (7.8 $\mu\text{g}/\text{L}$). VOCs were not detected in surface water or sediment samples collected at the site. VOC analytical results are presented in Tables 4 through 8.

Although some SVOCs were detected above SQLs in a few samples from the BM site, they are ubiquitous at the detected concentrations and are not known to be attributable to site operations. Polycyclic aromatic hydrocarbons (PAH) were detected above SQLs in two surface soil samples, phthalates were detected above SQLs in six surface and two subsurface soil samples, and phenol was detected above SQLs in two subsurface soil samples. The only SVOC detected in ground water samples was phenanthrene in sample BM-GW06 (6.7 µg/L), collected beneath the parking lot. PAHs such as phenanthrene are common constituents of asphalt. PAHs were detected in sediment samples, but the highest concentrations were found in sample BM-SD13 collected from Tioughnioga River under a railroad trestle. SVOCs were not detected above SQLs in surface water samples collected at the site. SVOC analytical results are presented in Tables 9 through 13.

Pesticides were not detected above SQLs in soil, ground water, or surface water samples collected at the site. A few pesticides were detected in sediment sample BM-SD03 from Perplexity Creek and from sediment samples collected from Tioughnioga River, but the compounds are not attributable to site operations. PCBs were not detected above SQLs in surface soil, ground water, or surface water samples. The only PCB detected above SQLs in subsurface soil was Aroclor-1254 in sample BM-SS21 (42 µg/kg). The only PCBs detected above SQLs in sediment were Aroclor-1248 (72 µg/kg) and Aroclor-1254 (64 J µg/kg) in sample BM-SD13, which was collected from Tioughnioga River under a railroad trestle. Pesticide and PCB analytical results are presented in Tables 14 through 18.

[Ref. 16, all pages]

The inorganic analytical results confirmed that chromium is the primary contaminant of concern at the site. Chromium was detected significantly above background (13.2 J and 13.7 J milligrams per kilogram [mg/kg] in samples BM-S01 and BM-SS01, respectively; J = estimated) in thirteen surface soil samples and one subsurface soil sample. The highest chromium concentrations were detected in surface samples BM-S14 (10,900 mg/kg), BM-S04 (5,250 J mg/kg), and BM-S13 (3,430 mg/kg), which were all collected directly beneath the slab of former Building 1. Mercury was detected significantly above background (0.024 U mg/kg in sample BM-SS01; U = not detected) in subsurface sample BM-SS24 (0.10 mg/kg). There were no other inorganic constituents detected significantly above background in soil samples collected at the BM site.

Chromium was detected above SQLs and significantly above background in ground water samples BM-GW04 (former Building 1 slab), BM-GW06 (parking lot), and BM-GW07 (Building 5), with individual concentrations ranging from 98 µg/L (BM-GW06) to 9,400 µg/L (BM-GW07 and duplicate BM-GW13). It should be noted that hexavalent chromium concentrations exceeded total chromium concentrations, likely due to the positive contribution of interfering species detected using the colorimetric procedure. Arsenic was detected above SQLs and significantly above background in ground water samples BM-GW05 (between Building 5 and former Building 1), BM-GW06, and BM-GW10 (gravel lot), with individual concentrations ranging from 1.4 µg/L (BM-GW06) to 19 µg/L (BM-GW05). Background concentrations of chromium and arsenic in sample BM-GW01 were 3.2 µg/L and 1.0 U µg/L, respectively.

Chromium, arsenic, and lead were detected above SQLs and significantly above background in surface water samples BM-SW02, its duplicate BM-SW10, and BM-SW07. Observed release concentrations of chromium ranged from 4.9 µg/L to 5.2 µg/L, while arsenic concentrations ranged

from 1.6 µg/L to 1.9 µg/L and lead was detected at 7.5 µg/L to 9.4 µg/L. Hexavalent chromium was detected in samples BM-SW02 (25 µg/L) and its duplicate BM-SW10 (16 µg/L). Chromium (2.0 U µg/L), hexavalent chromium (10 U µg/L), and arsenic (1.0 U µg/L) were not detected in background sample BM-SW01, and lead was detected at 1.2 µg/L.

Site-related inorganic constituents were not detected significantly above background in the open-well samples, drinking water samples, or sediment samples collected at the BM site. The inorganic analytical results are presented in Tables 19 through 23.

PART IV: HAZARD ASSESSMENT

GROUND WATER ROUTE

- 1. Describe the likelihood of a release of contaminant(s) to the ground water as follows: observed release, suspected release, or none. Identify contaminants detected or suspected and provide a rationale for attributing them to the site. For observed release, define the supporting analytical evidence and relationship to background.**

An observed release of chromium (including hexavalent chromium) and arsenic to on-site ground water is documented. Background concentrations of chromium and arsenic in sample BM-GW01 were 3.2 µg/L and 1.0 U µg/L (U = not detected), respectively. Chromium was detected above SQLs and significantly above background in ground water samples BM-GW04 (former Building 1 slab), BM-GW06 (parking lot), and BM-GW07 (Building 5), with individual concentrations ranging from 98 µg/L (BM-GW06) to 9,400 µg/L (BM-GW07 and duplicate BM-GW13). It should be noted that hexavalent chromium concentrations exceeded total chromium concentrations. Arsenic was detected above SQLs and significantly above background in ground water samples BM-GW05 (between Building 5 and former Building 1), BM-GW06, and BM-GW10 (gravel lot), with individual concentrations ranging from 1.4 µg/L (BM-GW06) to 19 µg/L (BM-GW05). The depths of ground water samples showing observed release concentrations ranged from approximately 5 to 10 feet below ground surface (bgs).

Arsenic and chromium are attributable to the site because they were both detected in sludge and other waste samples collected by RST. Chromium was also detected in some of the soil samples collected on site by SAT 2. Molybdenum was also detected significantly above background in ground water samples BM-GW05 and BM-GW06, but there is no attribution for molybdenum because there are no waste or soil data for that parameter.

[Ref. 3, pp. 7-11, 17-24; 7, Figure 3; 9, pp. 22-29, 98-110; 10, pp. 12-14, 64-65, 73-74, 86-88; 15, pp. 10, 13, 18-24, 36, 40-44, 56-60]

- 2. Describe the aquifer of concern; include information such as depth, thickness, geologic composition, areas of karst terrain, permeability, overlying strata, confining layers, interconnections, discontinuities, depth to water table, ground water flow direction.**

The aquifer of concern at the BM site is the glacial-aquifer system in the Cortland area, which is bound laterally by till-covered bedrock hills and beneath by the bedrock valley floor. The glacial-aquifer system consists of an unconfined sand and gravel aquifer 40 to 80 feet thick, a lacustrine confining layer 0 to 155 feet thick, and a confined sand and gravel aquifer 1 to 170 feet thick. The confining unit impedes vertical movement of ground water between the upper and lower aquifers in the middle of the valley, but the two aquifers are hydraulically connected in many places along the valley walls where the confining layer is absent. Ground water flow direction at the site is eastward, as indicated by on-site and regional information.

Site-specific information obtained during the subsurface investigation shows that there is gravelly fill material, typically a few feet thick, underlain by the unconfined sand and gravel aquifer. Ground water was encountered at depths ranging from approximately 2 to 10 feet bgs.

Geologic Unit	Depth (Approximate)	Thickness (Approximate)
Unconfined sand and gravel	5 feet	40-80 feet
Confined sand and gravel	40-235 feet	1-170 feet

[Ref. 7, Figure 2; 9, pp. 33-98; 18, pp. 1-2, 9-14, 17-22, plates 1-5]

3. What is the depth from the lowest point of waste disposal/storage to the highest seasonal level of the saturated zone of the aquifer of concern?

The depth from the lowest point of waste disposal/storage to the highest seasonal level of the aquifer of concern is 0 feet. This measurement is based upon the detection of site-attributable contaminants in ground water samples at depths ranging from 5 to 10 feet bgs, whereas the saturated zone was encountered as shallow as 2 feet bgs during the IA.

[Ref. 9, p. 98; 15, pp. 10, 13, 18-24, 36, 40-44, 56-60]

4. What is the permeability value of the least permeable continuous intervening stratum between the ground surface and the top of the aquifer of concern?

Deposits encountered above the saturated zone during drilling and monitoring well installation consist of sand and gravel fill. Deposits of this type have an estimated permeability of 10^{-2} centimeters per second (cm/s).

[Ref. 9, pp. 33-97; 19, p. 51601]

5. What is the net precipitation at the site (inches)?

The net precipitation at the site ranges from 15-30 inches.

[Ref. 19, pp. 51598, 51600]

6. What is the distance to and depth of the nearest well that is currently used for drinking purposes?

The nearest well currently used for drinking purposes is located approximately 1,000 feet southeast of the site. The depth of the well is approximately 30 feet.

[Ref. 7, Figure 3; 9, pp. 16, 18; 20, p. 1]

7. If a release to ground water is observed or suspected, determine the number of people that obtain drinking water from wells that are documented or suspected to be actually contaminated by hazardous substance(s) attributed to an observed release from the site.

No drinking water wells are known or suspected to be actually contaminated by hazardous substances attributed to the site. Chromium and arsenic were not detected in sample BM-DW03, which was collected from the nearest operational drinking water well.

[Ref. 9, pp. 16, 18; 10, pp. 18, 23, 50; 15, pp. 8-10]

8. Identify the population served by wells located within 4 miles of the site that draw from the aquifer of concern.

The total population served by wells located within 4 miles of the site that draw from the aquifer of concern is approximately 26,466 persons. There are two domestic wells located approximately 1,000 feet southeast of the site, serving four people. Four water districts (City of Cortland, Town of Cortlandville, Homer Village, and McGraw Village) operate public supply wells within 4 miles of the BM site.

<u>Distance</u>	<u>Population</u>
0 - 1/4 mile	4
>1/4 - 1/2 mile	0
>1/2 - 1 mile	0
>1 - 2 miles	20,000
>2 - 3 miles	3,200
>3 - 4 miles	3,262

[Ref. 7, Figure 4; 21, pp. 1-10]

State whether ground water is blended with surface water, ground water, or both before distribution.

Ground water from three wells within the City of Cortland public water system is blended together prior to distribution. The wells are located within 4 miles of the site.

[Ref. 7, Figure 4; 21, p. 3]

Is a designated wellhead protection area within 4 miles of the site?

There are designated wellhead protection areas (WHPA) within 4 miles of the BM site.

[Ref. 7, Figure 4; 21, pp. 2, 4, 7-8]

Does a waste source overlie a designated or proposed wellhead protection area? If a release to ground water is observed or suspected, does a designated or proposed wellhead protection area lie within the contaminant boundary of the release?

The waste sources do not overlie designated or proposed WHPAs. Designated or proposed WHPAs do not lie within the contaminant boundary of the observed release to ground water.

[Ref. 21, pp. 2, 7-8]

- 9. Identify one of the following resource uses of ground water within 4 miles of the site (i.e., commercial livestock watering, ingredient in commercial food preparation, supply for commercial aquaculture, supply for major, or designated water recreation area, excluding drinking water use, irrigation (5-acre minimum) of commercial food or commercial forage crops, unusable).**

Ground water within 4 miles of the site is used for commercial food preparation and irrigation of commercial food or forage crops. The predominant land use in the area is agriculture. In addition to the city, townships, and county, well owners in the area include a fish hatchery, creamery, baking company, and hospital.

[Ref. 7, Figure 4; 18, pp. 8, 27, 67-74]

SURFACE WATER ROUTE

- 10. Describe the likelihood of a release of contaminant(s) to surface water as follows: observed release, suspected release, or none. Identify contaminants detected or suspected and provide a rationale for attributing them to the site. For observed release, define the supporting analytical evidence and relationship to background.**

An observed release of chromium (including hexavalent chromium), arsenic, and lead to on-site surface water is documented. Chromium (2.0 U µg/L), hexavalent chromium (10 U µg/L), and arsenic (1.0 U µg/L) were not detected in background sample BM-SW01, and lead was detected at 1.2 µg/L. Chromium, arsenic, and lead were detected above SQLs and significantly above background in surface water samples BM-SW02, its duplicate BM-SW10, and BM-SW07. Observed release concentrations of chromium ranged from 4.9 µg/L to 5.2 µg/L, while arsenic concentrations ranged from 1.6 µg/L to 1.9 µg/L and lead was detected at 7.5 µg/L to 9.4 µg/L. Hexavalent chromium was detected in samples BM-SW02 (25 µg/L) and its duplicate BM-SW10 (16 µg/L).

Arsenic, chromium, and lead are attributable to the site because they were all detected in sludge and other waste samples collected by RST. Chromium was also detected in some of the soil samples collected on site by SAT 2.

[Ref. 3, pp. 7-11, 17-24; 7, Figure 3; 9, pp. 25-30; 10, pp. 15-16, 73-74, 86-87; 15, pp. 27-28, 32, 46-55]

- 11. Identify the nearest down slope surface water. If possible, include a description of possible surface drainage patterns from the site.**

The nearest down slope surface water, Perplexity Creek, flows through the BM site. The creek enters the site from the north via culverts under railroad tracks and the site parking lot, resurfaces in the eastern portion of the site, and continues to flow southeast. Perplexity Creek flows from the probable point of entry (PPE) where it resurfaces for approximately ½ mile to Tioughnioga River, which makes up the remainder of the 15-mile target distance limit (TDL). There is another PPE to an isolated on-site wetland that appears to have been a retention basin.

[Ref. 2, p. 5; 6, p. 1; 7, Figures 2, 5; 9, pp. 4-7, 122, 147, 161; 10, pp. 15, 23]

- 12. What is the distance in feet to the nearest down slope surface water? Measure the distance along a course that runoff can be expected to follow.**

The distance to the nearest down slope surface water is 0 feet to Perplexity Creek, which flows through the BM site.

[Ref. 2, p. 5; 7, Figures 2, 5; 10, pp. 15, 23]

13. Identify all surface water body types within 15 downstream miles.

<u>Name</u>	<u>Water Body Type</u>	<u>Flow (cfs)</u>	<u>Saline/Fresh/Brackish</u>
Perplexity Creek	Minimal Stream	< 10	Fresh
Tioughnioga River	Moderate to Large Stream	> 100-1000	Fresh

[Ref. 7, Figure 5; 19, p. 51613; 22, p. 1; 23, pp. 1-2]

14. Determine the 2-yr, 24-hr rainfall (inches) for the site.

The 2-year, 24 hour rainfall for the BM site is approximately 2.7 inches.

[Ref. 24, p. 4]

15. Determine size of the drainage area (acres) for sources at the site.

The drainage area, which includes the site and a small open area to the northwest, is approximately 60 acres. The drainage area is bounded on the north and northwest by roadways and on the southwest by railroad tracks.

[Ref. 6, p. 1; 7, Figure 3]

16. Describe the predominant soil group in the drainage area.

The predominant soil group encountered at the site consists of coarse-textured soils (i.e., gravel and sand), which are evaluated under soil group designation A.

[Ref. 9, pp. 33-95; 19, p. 51611]

17. Determine the type of floodplain that the site is located within.

The BM site is situated within a 100-year flood zone.

[Ref. 25, pp. 1-2]

18. Identify drinking water intakes in surface waters within 15 miles downstream of the point of surface water entry. For each intake identify: the name of the surface water body in which the intake is located, the distance in miles from the point of surface water entry, population served, and stream flow at the intake location.

There are no known surface water intakes within 15 miles of the PPE.

[Ref. 18, pp. 17-18; 21, pp. 1-10]

- 19. Identify fisheries that exist within 15 miles downstream of the point of surface water entry. For each fishery specify the following information:**

<u>Fishery Name</u>	<u>Water Body Type</u>	<u>Flow (cfs)</u>	<u>Saline/Fresh/Brackish</u>
Tioughnioga River	Moderate to Large Stream	> 100-1000	Fresh

[Ref. 22, p. 1; 23, pp. 1-2]

- 20. Identify surface water sensitive environments that exist within 15 miles of the point of surface water entry.**

<u>Environment</u>	<u>Water Body Type</u>	<u>Flow (cfs)</u>	<u>Wetlands Frontage</u>
Wetlands	Minimal Stream	<10	2,500 feet
Wetlands	Moderate to Large Stream	>100-1000	37,802 feet
Two State-Listed Threatened Species*	Moderate to Large Stream	>100-1000	N/A

* Brook Floater (*Alasmidonta varicosa*) and Green Floater (*Lasmigona subviridis*). The nearest habitat for these species is in Tioughnioga River at the confluence with Perplexity Creek, at a distance of approximately 0.5 mile downstream of the BM site.

[Ref. 7, Figures 4-5; 22, p. 1; 26, p. 1; 27, pp. 1-10]

- 21. If a release to surface water is observed or suspected, identify any intakes, fisheries, and sensitive environments from question Nos. 18-20 that are or may be actually contaminated by hazardous substance(s) attributed to an observed release of from the site.**

Approximately 660 feet (0.12 mile) of the delineated wetlands along Perplexity Creek is subject to actual contamination, with the remainder evaluated as uncontaminated wetlands. The length of contaminated wetlands is measured along both sides of Perplexity Creek between observed release samples BM-SW02 and BM-SW07. .

[Ref. 7, Figure 3; 9, pp. 25-30; 10, pp. 15-16, 73-74, 86-87; 15, pp. 27-28, 32, 46-55; 26, p. 1]

- 22. Identify whether the surface water is used for any of the following purposes, such as: irrigation (5 acre minimum) of commercial food or commercial forage crops, watering of commercial livestock, commercial food preparation, recreation, potential drinking water supply.**

There are no known intakes located along the 15-mile surface water migration pathway; therefore, it is not likely that surface water is used for any of the purposes listed above.

[Ref. 18, pp. 17-18; 21, pp. 1-10]

SOIL EXPOSURE PATHWAY

- 23. Determine the number of people that occupy residences or attend school or day care on or within 200 feet of observed contamination.**

There are no residences, schools, or day care centers on or within 200 feet of observed contamination. However, there are approximately 4,068 people residing within 1 mile of the site. Direct contact by nearby residents with the on-site contamination is unlikely because the BM facility is fenced and has 24-hour security while EPA is at the site.

[Ref. 9, pp. 2-4; 28, pp. 1-2, 5]

- 24. Determine the number of people that regularly work on or within 200 feet of observed contamination.**

Although EPA removal activities at the site are ongoing, the BM facility is currently inactive and utilities serving the site are not operational. Therefore, there are no permanent workers on or within 200 feet of observed contamination.

[Ref. 4, p. 14; 9, pp. 2-4]

- 25. Identify terrestrial sensitive environments on or within 200 feet of observed contamination.**

There are no terrestrial sensitive environments on or within 200 feet of the site.

[Ref. 27, pp. 1-10]

- 26. Identify whether there are any of the following resource uses, such as commercial agriculture, silviculture, livestock production or grazing within an area of observed or suspected soil contamination.**

There are none of the listed resource uses within the area of observed soil contamination.

[Ref. 4, pp. 14-15; 7, Figure 3; 9, pp. 2-95, 113-161]

AIR PATHWAY

- 27. Describe the likelihood of release of hazardous substances to air as follows: observed release, suspected release, or none. Identify contaminants detected or suspected and provide a rationale for attributing them to the site. For observed release, define the supporting analytical evidence and relationship to background.**

A release to air is neither observed nor suspected. The facility has been inactive since May 2005, and there are no ongoing emissions from the facility. There were no readings above background on air-monitoring instrumentation at the commencement of removal activities in January 2007 or during removal activities in July 2008. The BM site is being evaluated as a potential source of ground water and surface water contamination; no air samples were collected by SAT 2 during the IA sampling event.

[Ref. 4, pp. 59-122; 8, pp. 1-63; 9, pp. 2-7; 10, pp. 5-18; 29, pp. 1-4]

- 28. Determine populations that reside within 4 miles of the site.**

There are an estimated 29,355 residents within 4 miles of the BM site.

<u>Distance</u>	<u>Population</u>
On site	0
>0 - ¼ mi	57
>¼ - ½ mi	1,380
>½ - 1 mi	2,631
>1 - 2 mi	14,158
>2 - 3 mi	4,770
>3 - 4 mi	6,359

[Ref. 28, pp. 1-6]

- 29. Identify sensitive environments, including wetlands and associated wetlands acreage, within 4 miles of the site.**

<u>Distance</u>	<u>Wetlands Acreage</u>	<u>Sensitive Environments</u>
0- ¼ mi	1.29	None identified.
>¼ - ½ mi	1.65	None identified.
>½ - 1 mi	24.04	None identified.
>1 - 2 mi	61.85	None identified.
>2 - 3 mi	105.86	None identified.
>3 - 4 mi	163.42	None identified.

[Ref. 7, Figure 4; 26, p. 1]

- 30. If a release to air is observed or suspected, determine the number of people that reside or are suspected to reside within the area of air contamination from the release.**

A release to air is not observed or suspected; see Question No. 27 for a description of the likelihood of a release.

- 31. If a release to air is observed or suspected, identify any sensitive environments, listed in question No. 29, that are or may be located within the area of air contamination from the release.**

A release to air is not observed or suspected; see Question No. 27 for a description of the likelihood of a release.
