On-Scene Coordinator
United States Environmental Protection Agency, Region V
77 West Jackson Boulevard
Chicago, IL 60604

**Subject: Baycote Metals Finishing Site Removal Action
Mishawaka, Saint Joseph County, Indiana
Contract No.: EP-S5-06-04
Technical Direction Document No.: S05-0001-1205-001
Document Control No.: 1843-2A-BBTW
Work Order No.: 20405.012.001.1843.00**

Dear Mr. Atkociunas:

Under Technical Direction Document No. S05-0001-1205-001, the United States Environmental Protection Agency (U.S. EPA) tasked the Weston Solutions, Inc. (WESTON[®]), Superfund Technical Assessment and Response Team (START) to provide oversight of removal action activities at the Baycote Metals Finishing Site in Mishawaka, Saint Joseph County, Indiana (the Site). This letter report discusses analytical results and sampling activities for the Site that were conducted in accordance with the site-specific Field Sampling Plan (FSP) dated September 24, 2012, and the Quality Assurance Project Plan (QAPP) dated October 23, 2012, both prepared by WESTON START.

This letter report discusses the Site description, Site history, removal action activities, and removal action sample analytical results. In addition, this letter report has six attachments. **Attachment A** provides the figures for this letter report. **Attachment B** provides a photographic log of removal action sampling and other activities. **Attachment C** provides the Structural Condition Report for the Site building. **Attachment D** provides the U.S. EPA Field Environmental Decision Support (FIELDS) Team Geophysical Survey Report. **Attachment E** provides tables summarizing the sampling data. **Attachment F** provides the laboratory analytical results and data validation report for samples collected during the removal action.

SITE DESCRIPTION

The Site is located at 1302 Industrial Drive in Mishawaka, Saint Joseph County, Indiana (**Figure 1** in **Attachment A**). The Site coordinates are 41°39'0.03" North latitude and 86°09'57.11" West longitude. The Site is bordered to the north and south by industrial properties; to the west by Industrial Drive, with industrial properties beyond; and to the east by a vacant lot, with industrial properties beyond (**Figure 2** in **Attachment A**). The nearest residential properties are located approximately 730 feet west of the Site. The Site contains a large building divided into multiple areas (**Figure 3** in **Attachment A**).

Mr. Paul Atkociunas
U.S. EPA

-2-

Baycote Metals Finishing Site
January 2, 2013

SITE HISTORY

The Site is a former chrome plating shop and metal finishing facility. After the closure of the facility, the property owner began voluntary removal of on-site wastes but never completed the removal. According to an Indiana Department of Environmental Management (IDEM) Inspection Summary Letter dated February 15, 2010, approximately 52,000 gallons of hazardous waste were present on site.

On November 18, 2011, the U.S. EPA received a request from the Saint Joseph County Health Department (SJCHD) to mitigate the potential for imminent and substantial threats to the public health or welfare of the United States or the environment at the Site. On November 21, 2011, the U.S. EPA and SJCHD conducted an initial Site walkthrough at the facility. The inspection noted a large number of drums, totes, and vats containing various acids and caustics stored in the facility.

In December 2011, the U.S. EPA and WESTON START conducted a site assessment and identified over 332 drums, vats, and other miscellaneous containers throughout the Site. Most containers were labeled, but the volumes of the contents were unknown. Containers identified during the site assessment contained various materials, including the following: zinc cyanide solution, chloride zinc acid, yellow chromate, acid copper bath, black hexavalent chromate post dip, sulfuric acid, hydrochloric acid, and unlabeled and unidentified materials. The site assessment documented the following conditions at the Site:

- Wastes exhibiting the characteristics of ignitability, corrosivity, Toxicity Characteristic Leaching Procedure (TCLP) cadmium, and TCLP chromium
- Contaminants in open containers in poor condition
- Questionable integrity of the building structure (collapsed roof in the former wastewater treatment [WWT] area [Area W] and flooding in the Line 4-7 Room [Area C])
- Close proximity of Site to residential properties and other sensitive receptors (including churches, schools, and waterways)
- Potential pathways for waste inside the on-site building to migrate to public areas

From May 29 through November 2, 2012, the U.S. EPA conducted a removal action at the Site to mitigate imminent and substantial threats to the public health or welfare of the United States or the environment at the Site.

REMOVAL ACTION ACTIVITIES

WESTON START prepared a site-specific FSP dated September 24, 2012, and QAPP dated October 23, 2012, that document the following sampling activities:

Mr. Paul Atkociunas
U.S. EPA

-3-

Baycote Metals Finishing Site
January 2, 2013

- Collection of one sludge sample from tank J-12 for analysis of total and reactive cyanide, Target Analyte List (TAL) metals (including total hexavalent chromium), and TCLP metals
- Collection of soil samples from the field east of the Site building for analysis of total and reactive cyanide, total Resource Conservation and Recovery Act (RCRA) metals (including total hexavalent chromium), TCLP metals, TCLP volatile organic compounds (VOC), TCLP semivolatile organic compounds (SVOC), and polychlorinated biphenyls (PCB)
- Collection of liquid samples from the former WWT area located in Area W for analysis of total and reactive cyanide, ignitability, pH, and total RCRA metals (including total hexavalent chromium)
- Collection of sludge samples from the former WWT area located in Area W for analysis of total and reactive cyanide, TCLP metals, and total RCRA metals (including total hexavalent chromium)

Attachment B provides a photographic log of sampling activities. A chronology of sampling activities is presented below.

September 26, 2012

WESTON START collected one sludge sample (BMF-WS01-092612) from tank J-12 in Area W (**Figure 4A** in **Attachment A**). WESTON START submitted the sample to Microbac Laboratories, Inc., in Merrillville, Indiana, for analysis of total and reactive cyanide, TAL metals (including total hexavalent chromium), and TCLP metals.

October 4, 2012

Keller Engineering, Inc., of South Bend, Indiana, performed a visual inspection to assess the structural safety of various portions of the Site building. Based on the Structural Condition Report dated October 12, 2012 (**Attachment C**), the level of deterioration varies throughout the building depending on proximity to corrosive operations, age, and type of construction. Concrete portions of the building largely are unaffected, but metal components are in various stages of decay. In general, hot-rolled shapes (such as beams, columns, and plates) still have adequate strength. Thin sheet-metal components (such as metal decking, light gage purlins, and light-weight bar joists) are in questionable condition because of the thinness of the metal parts, where even minor corrosion causes significant loss of strength.

October 17, 2012

The U.S. EPA FIELDS Team conducted a geophysical survey of the field east of the on-site building. According to the Geophysical Survey Report dated October 16, 2012 (**Attachment D**), the U.S. EPA FIELDS Team used the following geophysical instruments: a cesium vapor

Mr. Paul Atkociunas
U.S. EPA

-4-

Baycote Metals Finishing Site
January 2, 2013

gradient magnetometer, a high-sensitivity time-domain electromagnetic metal detector, a broad-frequency domain electromagnetic sensor, and a ground-penetrating radar detector. An anomalous area was identified in the southern region of the investigation area (east of the Site building). The report indicates that the anomalous area most likely is caused by surface metal just below ground surface.

October 22, 2012

WESTON START collected six (five investigative and one duplicate) soil samples (BMF-S01-102212 through BMF-S05-102212 and BMF-S03-102212D) from the field east of the Site Building (**Figure 5 in Attachment A**). Based on the results of the geophysical survey, the Emergency and Rapid Response Services (ERRS) contractor excavated test pits in the anomalous area using a mini-excavator. Evidence of waste burial (drums, containers, and plating waste) was not observed. However, metal debris (bolts and nuts) was present at or near the ground surface. Samples BMF-S01-102212 and BMF-S02-102212 were collected from the anomalous area. The remaining samples were collected in the field at the direction of the U.S. EPA On-Scene Coordinator. The samples were submitted to Pace Analytical Services, Inc. (Pace), in Indianapolis, Indiana, for analysis of total and reactive cyanide, total RCRA metals (including total hexavalent chromium), TCLP metals, TCLP VOCs, TCLP SVOCs, and PCBs.

October 29, 2012

WESTON START collected six (five investigative and one duplicate) liquid samples (BMF-WL01-102912 through BMF-WL05-102912 and BMF-WL01-102912D) from the former WWT area located in Area W (**Figure 4B in Attachment A**). The samples were submitted to Pace in Indianapolis, Indiana, for analysis of total and reactive cyanide, ignitability, pH, and total RCRA metals (including total hexavalent chromium).

WESTON START also collected six (five investigative and one duplicate) sludge samples (BMF-WS01-102912 through BMF-WS05-102912 and BMF-WS01-102912D) from the former WWT area located in Area W (**Figures 4A and 4B in Attachment A**). The samples were submitted to Pace in Indianapolis, Indiana, for analysis of total and reactive cyanide, TCLP metals, and total RCRA metals (including total hexavalent chromium).

REMOVAL ACTION SAMPLE ANALYTICAL RESULTS

During the removal action, WESTON START collected the sludge, soil, and liquid samples discussed under "Removal Action Activities" above. The sample results were compared to the following screening criteria:

- Sludge – Title 40 of the *Code of Federal Regulations* (CFR), Part 261
- Soil – 40 CFR, Part 261, and U.S. EPA Regional Screening Levels (RSL) – Industrial Soil

- Liquid – 40 CFR, Part 261

Figures 4A, 4B, and 5 in Attachment A show the sampling locations. **Attachment F** provides the laboratory analytical report and the data validation report for the samples.

The laboratory analytical results for the sludge sample collected from tank J-12 are summarized in **Table 1 in Attachment E** and discussed below.

- Sample BMF-WS01-092612
 - The sample contained TCLP cadmium at 6.66 milligram per liter (mg/L), which exceeds the TCLP cadmium regulatory limit of 1.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of hazardous waste for the characteristic of toxicity (D006).
 - The sample contained TCLP chromium at 31.2 mg/L, which exceeds the TCLP chromium regulatory limit of 5.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of hazardous waste for the characteristic of toxicity (D007).

The laboratory analytical results for soil samples collected from the field east of the Site building are summarized in **Table 2 in Attachment E**. None of the results exceeded the 40 CFR, Part 261, screening criteria. In addition, none of the results exceeded the U.S. EPA RSLs – Industrial Soil except for the total arsenic results, which exceeded the RSL of 1.6 milligrams per kilogram (mg/kg) as summarized below.

- Sample BMF-S01-102212: Arsenic at 6.7 mg/kg
- Sample BMF-S02-102212: Arsenic at 9.9 mg/kg
- Sample BMF-S03-102212: Arsenic at 6.2 mg/kg
- Duplicate sample BMF-S03-102212D: Arsenic at 6.4 mg/kg
- Sample BMF-S04-102212: Arsenic at 12.7 mg/kg
- Sample BMF-S05-102212: Arsenic at 14.6 mg/kg

The laboratory analytical results for the liquid samples collected from the former WWT area located in Area W are summarized in **Table 3 in Attachment E**. None of the results exceeded the 40 CFR, Part 261, screening criteria.

The laboratory analytical results for the sludge samples collected from the former WWT area located in Area W are summarized in **Table 4 in Attachment E**. Only the results for samples BMF-WS01-102912D, BMF-WS02-102912, and BMF-WS04-102912 exceeded the screening criteria as discussed below.

Baycote Metals Finishing Site
January 2, 2013

- Duplicate sample BMF-WS01-102912D
 - The sample contained TCLP cadmium at 5.1 mg/L, which exceeds the TCLP cadmium regulatory limit of 1.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of hazardous waste for the characteristic of toxicity (D006).
- Sample BMF-WS02-102912
 - The sample contained TCLP cadmium at 4.6 mg/L, which exceeds the TCLP cadmium regulatory limit of 1.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of hazardous waste for the characteristic of toxicity (D006).
- Sample BMF-WS04-102912
 - The sample contained TCLP cadmium at 3 mg/L, which exceeds the TCLP cadmium regulatory limit of 1.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of hazardous waste for the characteristic of toxicity (D006).
 - The sample contained TCLP chromium at 9.5 mg/L, which exceeds the TCLP chromium regulatory limit of 5.0 mg/L. Therefore, according to 40 CFR 261.24(b), this sample represents material that meets the definition of hazardous waste for the characteristic of toxicity (D007).

If you have any questions or comments regarding this report, please contact me at (312) 424-3314.

Very truly yours,
Weston Solutions, Inc.

Trena J. Seilheimer
WESTON START Project Manager

RE: BAYCOTE STRUCTURAL CONDITION REPORT Engineer's Project No. 1210-102

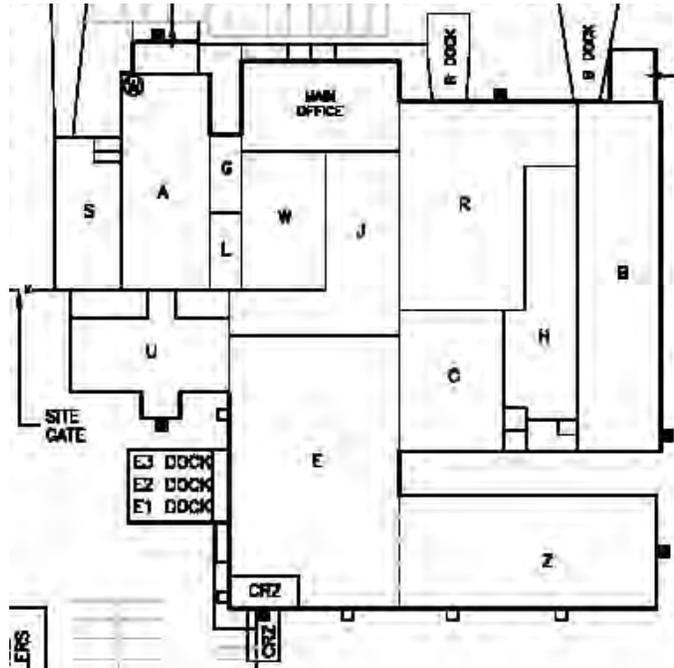

Thursday, October 4, 2012, Rick D. Keller P.E. inspected the BayCote Facility located at 1302 Industrial Drive, Mishawaka, Indiana. The purpose of the inspection was to assess the structural safety of the various portions of the building so that Environmental Restoration LLC could perform an environmental cleanup of this US EPA Superfund Site. A portion of the building complex roof had collapsed bringing into question

the safety of the building. Those accompanying Mr. Keller included Paul Atkociunas, Federal On-Scene Coordinator U.S. EPA Region 5 and Toby Viehweg of Environmental Restorations LLC.

The building housed the former Baycote Metal Finishing operations which incorporated corrosive chemicals into their processes and created corrosive environments which have attacked portions of the building structure from the inside. The level of deterioration varied throughout the facility depending on its proximity to the corrosive operations, the age, and the type of building. The concrete portions of the structure were largely unaffected, but metal components were in various stages of decay. In general hot rolled shapes such as beams, columns and plates still had adequate strength. Thin sheet metal components such as metal decking, light gage purlins, and light-weight bar joists were questionable. Since they were made of thin metal parts, even minor corrosion caused significant losses of strength.

The facility consisted of a conglomeration of several structures joined together. The diagram to the left produced from US EPA Figure 3-1 shows the various areas. A copy of this figure with our comments is attached. Areas that were most severely affected were W, J, and U. This report will discuss those areas in depth, and includes a brief review of the other areas of the plant.

BUILDING E AND Z

We entered the plant through buildings E and Z. These were newer pre-engineered steel warehouse type buildings. Since they were relatively new and far from the corrosive operations, both buildings were in good condition and were safe for operations.

BUILDING J

Building J was a much older structure that consisted of steel columns and beams, steel bar joists, and a metal roof deck. It was much closer to the corrosive operations and was in poor condition. Areas of the roof deck were rusted away, and many of the bar joists had lost significant strength due to the corrosion. We recommend providing temporary shoring under badly rusted bar joists. If a small section of metal deck fails, it is possible that rigid foam insulation and the roofing could fall into the space. The risk of serious injury from these light-weight materials is low, but all occupants should wear hard hats as a precaution.

The shoring could consist of 4x4 adjustable shores placed under a panel point near the center of the joist span. A panel point is where the round bar webbing connects with the bottom chord. If a row of shores is installed under adjacent bar joists, install cross bracing between the posts to prevent side sway of the bottom of the bar joists and top of the columns. When the shoring is installed, do not try to lift the roof, but make sure the shores are snug against the bottom of the joist. The intention is not to raise the joist but to prevent it from sagging farther.

BUILDING W

Building W housed the waste pre-treatment plant. This was a very corrosive environment. A portion of the roof of this structure had collapsed. The building was a pre-engineered steel structure, and it had rigid steel main frames fabricated from plate steel welded to form the beams and columns. The main frames have retained much of their strength. The purlins that span between the main frames are formed sheet metal. Some of them have lost much of their strength, and many have failed causing the partial collapse. Fiberglass insulation with a vinyl liner was draped over the purlins, and it protected the sheet metal roof deck from corrosion. Without the support of the purlins, the roof deck could not span between the main frames.

The purlins, fiberglass insulation and roof deck must be removed before remediation can take place in the building. There was much discussion about whether a crane could reach this area without first demolishing a building on the periphery. In our opinion, that would not be necessary. The purlins and roof decking are light weight, and once cut free of the rest of the building, they could be cut up and removed by hand. Smaller equipment such as a Lull or fork lift could be used to support sections of the roof while other areas are cut away. Since the main frames have retained most of their strength, it would not be necessary to remove them. They should be braced against falling sideways because they depend on the purlins and roof deck for that bracing.

The contractor should be aware that each layer provides lateral bracing for the element below it. Care should be taken to stay out from under the structure as it is being cut away. Do not remove an entire bay before moving to adjacent bays because that could place large lateral loads on the main frames. Instead, we suggest removing one or two rows of purlins across the length of the building before taking the next rows of purlins.

The tanks containing contaminants are supported by bar grates over concrete storage tanks. We do not know how deep the tanks are because they are full of water. We do not recommend walking on the bar grates because they are supported by badly corroded steel beams. Temporary self-supported scaffolding should be constructed over the tanks to provide access to the chemical containers. Once they have been removed, the bar grates should be removed to provide access to the concrete tanks below.

BUILDING U

Building U was also a pre-engineered building, but it had a gable shaped roof. The purlins were light gage Z purlins similar to building W, but they were a little heavier and were not as badly corroded. None of the purlins have failed. One of the columns on the south end wall was corroded at its base badly enough for it to crush downward. Since it was an end wall column, the frame had intermediate columns which eliminate the outward thrust at the bottom of the columns. Therefore, although the bottom of the column has crushed downward, it is not in danger of collapsing.

Since the roof purlins have corroded, we do not believe the building will be safe to enter when it has a significant snow load on the roof. Prior to that, no roof failures are likely. We do not recommend working in the building during periods of high wind. Otherwise, it should be safe to remove the contaminated equipment. We recommend cutting the suspending wires loose from the roof in a way that does not increase loads to the roof.

In our opinion it is possible to safely complete the remediation if these recommendations are followed. This was a visual inspection only. The assessment is based solely on the judgment of Mr. Keller based on his visual observations. As demolition proceeds, Keller Engineering should be consulted if any unexpected conditions are uncovered. We are also available to consult with you regarding demolition procedures but remind you that Environmental Restoration LLC is responsible for means and methods for the work.

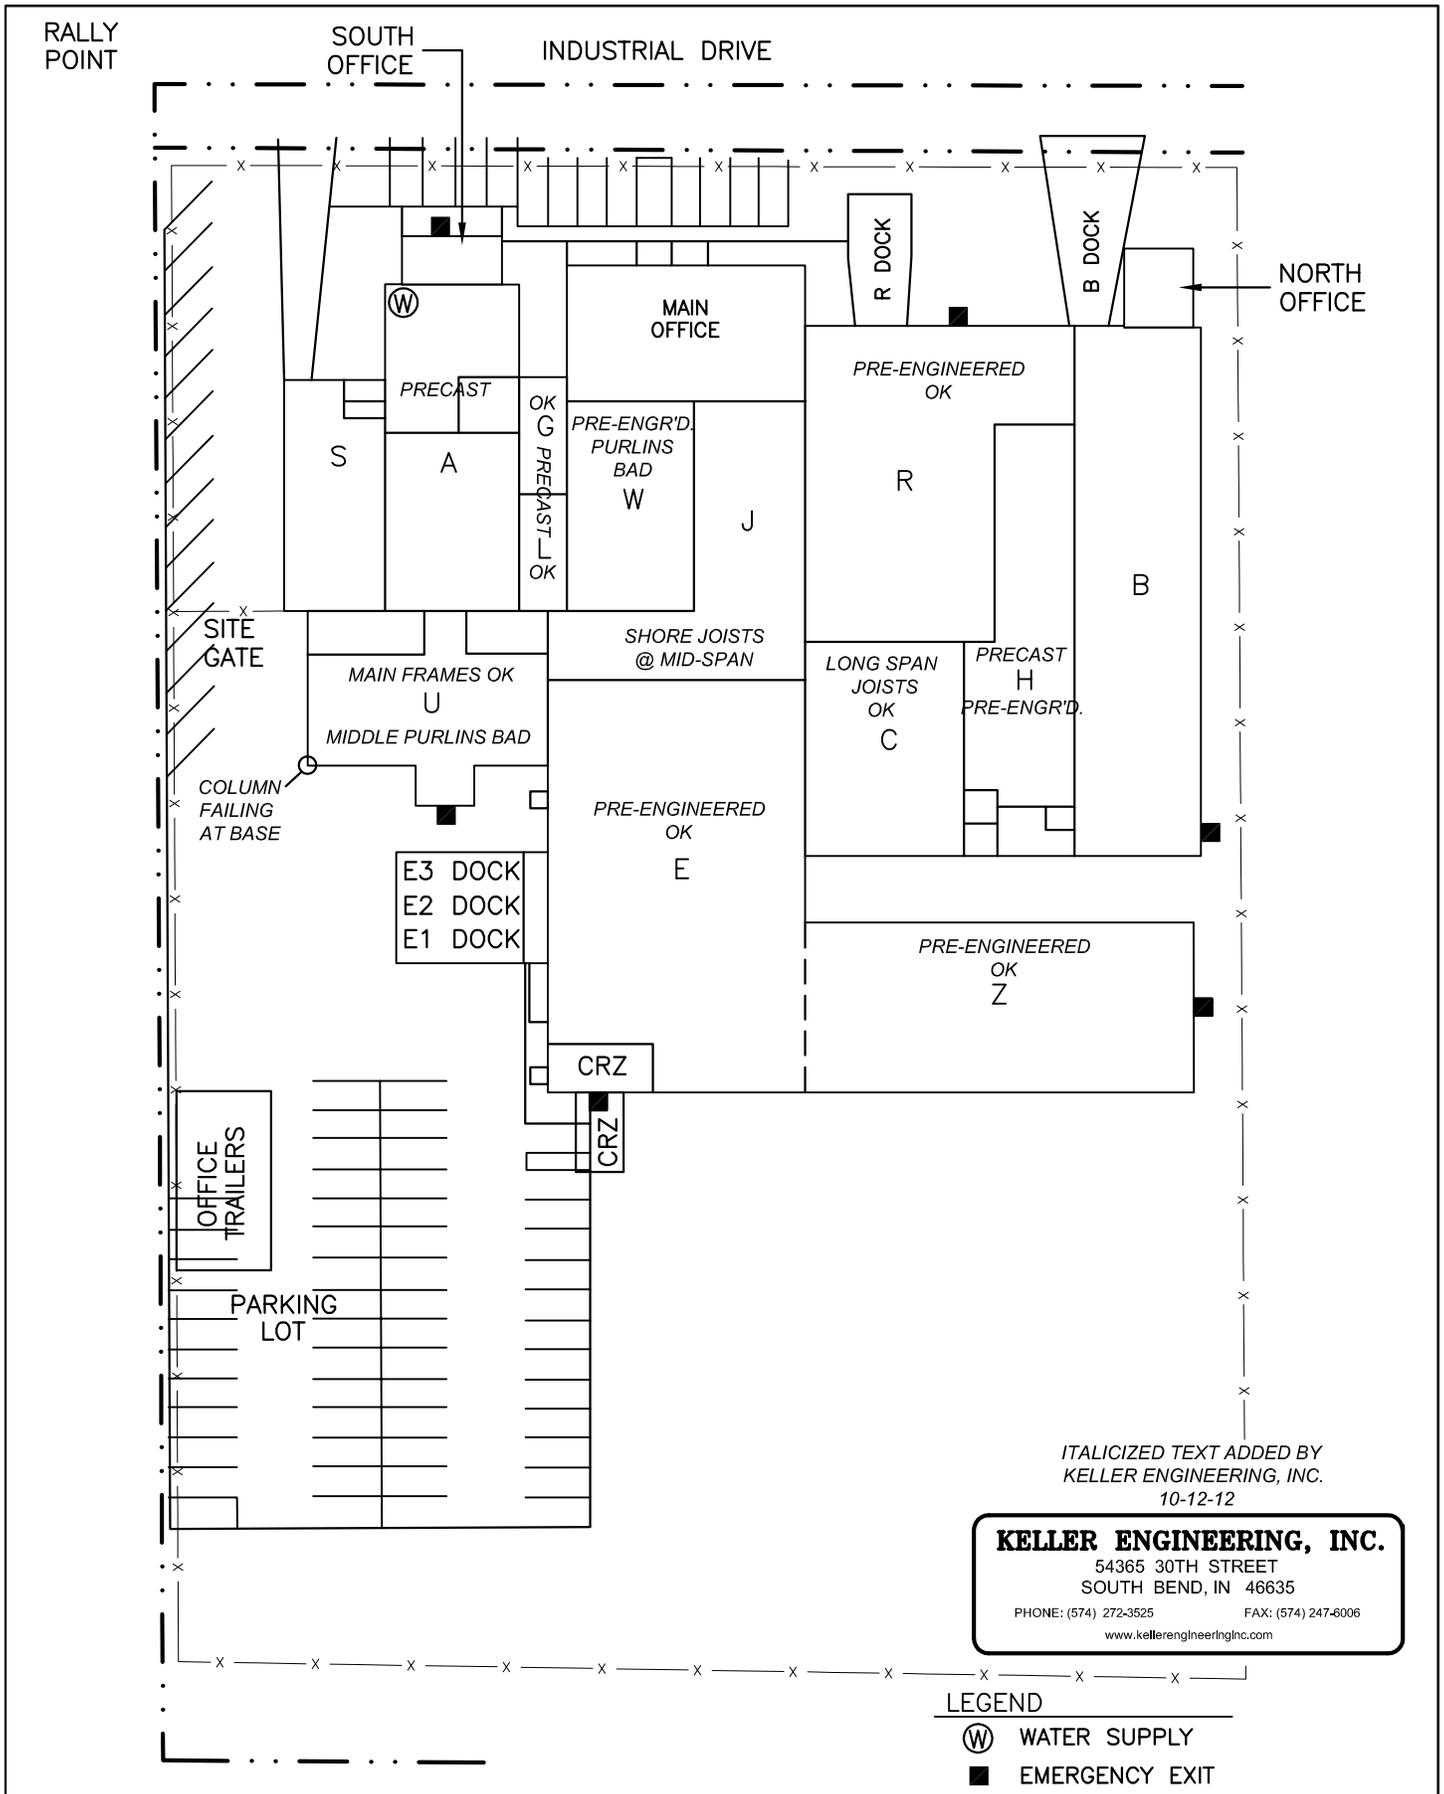

If you have any questions about the report, please call.

Sincerely,

Rick D. Keller P.E.

Chicago, Illinois**

Introduction

At the request of Paul Atkociunas, USEPA On-Scene Coordinator Region 5, a geophysical survey was conducted at the Baycote Metal Finishing site, 1302 Industrial Drive in Mishawaka, Indiana (see Figures 1 and 2) on October 16, 2012. The purpose of the survey was to locate possible buried tanks or other significant subsurface metallic objects, if any, on the subject property. Present during the survey besides the survey operator were Paul Atkociunas and several USEPA contractors.

Several geophysical instruments were used at this site and included a cesium vapor gradient magnetometer, a high sensitivity time domain electromagnetic metal detector, a broadband frequency domain electromagnetic sensor and ground penetrating radar.

Site Conditions

The site consists of several vacant buildings some of which were actively being remediated and a vacant lot at the rear, or eastern portion, of the property. The vacant lot was fairly level with vegetation to the north and east; scrap metal at the northwest boundary and a ditch at the eastern boundary. Portions of the vacant lot were recently brush hogged and cleared areas had abundant vegetative stubble which would prevent good ground coupling for using ground penetrating radar.

Access to the site for maneuvering geophysical equipment was hampered by three obstructions; vegetation, a post supporting an AreaRAE™ device and cut vegetation which was consolidated and piled in several areas the survey area. Such obstacles had a larger impact on the wheeled metal detector cart. One pile of cut vegetation at the southwest corner of the site was moved between operation of the magnetometer and electromagnetic tools to allow access to the area.

Weather conditions during the survey were mild.

Field Procedures

Geophysical instruments were deployed in the following order, gradient magnetometer, high sensitivity metal detector, broadband electromagnetic sensor and ground penetrating radar. Only the magnetometer and broadband electromagnetic sensor were traversed over a systematic grid. The high sensitivity electromagnetic metal detector and ground penetrating radar were only used on areas suspected of having anomalies.

Gradient Magnetometer

This instrument is limited to detecting ferrous metals (materials containing iron) and was the first instrument deployed at the site. Depth detection limits are dependent on the size and mass of the ferrous metal. Lateral sensor detection extents are also dependent on the amount of mass present and may extend slightly beyond the actual source limits.

The magnetic survey was conducted using a Geometrics G-858G cesium vapor gradient magnetometer in a vertical gradient mode, one meter spacing. Sensor orientation had a configuration of rotation at 45 degrees with a tilt angle set to 0 degrees, per manufacture's guidance document. Units were measured in gammas per meter. An instrument self-test was initiated and passed prior to the survey.

Data collection was guided by a Trimble AgGPS parallel swathing unit set to an interval of 5 feet. The AgGPS unit was augmented with a differential correction process using OmniSTAR service for sub-meter accuracy. Traverses were walked in alternating paths trending north and south, and also in east-west alternating paths in an effort to collect additional data. These traverses are shown as yellow dots in Figures 3, & 4. In some areas these yellow dots indicate circular patterns, this occurred when an above ground obstacle was encountered and the operator walked in a circle around the object thus making this information part of the data set.

The area investigated was bounded by the building to the west; vegetation and trees to the north; trees, vegetation and a ditch to the east; and the asphalt parking lot to the south. This boundary is illustrated on Figure 1.

A definitive description of any ferrous anomalies such as scrap metal, automobiles, drums, etc. is almost impossible to determine since no one value is unique to a specific object. However, an idea of metal mass concentrations can be inferred since the magnetic intensity of an anomaly increases as mass of the metal increases.

Broadband Electromagnetic Induction Tool

The Geophex - Aeroquest GEM-2 is a frequency domain electromagnetic induction tool which measures simultaneously in two modes, a metal detection mode and a ground conductivity mode. The unit has selectable frequency options allowing the operator to have *some* control of the certain depth intervals. However, each frequency is not definitively depth specific due to variability of soil/rock type, moisture content, chemical composition, and metals present.

The tool's capabilities in the metal detection mode can detect any type of metal while in the ground conductivity mode can detect changes in electrical properties in the soil and under the right conditions could detect contaminant plumes if there is a strong enough difference between native soils and the contaminate.

Five frequencies were used for this survey and were: 450 Hz, 1,130 Hz, 3,930 Hz, 13,590 Hz, and 35,010 Hz. Each frequency enables data to be collected from differing intervals with the highest frequencies being near surface and the lowest frequencies collecting data deeper within the subsurface. It is estimated that the highest frequency (35,010 Hz) is collecting data at -3 feet below ground surface with subsequent frequencies each collecting data another -3 feet below the previous frequency. So the lowest frequency (450 Hz) is estimated to be collecting data -15 feet below ground level. An instrument self-test was initiated and passed prior to the survey.

Geophex - Aeroquest GEM-2 data were collected in alternating north-south traverses approximating the same traverses as the magnetometer, and line spacing was established every five feet. No east-west traverses were used to collect data. The operator wore a Garmin puck type GPS antenna on his hard hat to document traverses using a WAAS based system and plotted using WGS 1984. The accuracy of the Garmin is probably within 10 feet and the traverse paths shown in Figures 5 and 8 do not exactly represent the true paths since the operator was following flagging markers which provided a more accurate straight line traverse.

High Sensitivity Electromagnetic Metal Detector

The Geonics EM61-MK2 instrument is capable of sensing any type of metal to a depth approximately 12 to 15 feet below the sensors and was the second instrument deployed at the site. The lateral extent of detection is narrowly limited to the size of the antennas which are 1 Meter wide (parallel to direction of travel) and 0.5 Meter long (perpendicular to direction of travel).

The EM61-MK2 was only used for this project on anomalous areas established by magnetic and electromagnetic methods to take advantage of this instrument's capability to delineate shapes of metallic anomalies. An instrument self-test was initiated and passed prior to the survey.

Ground Penetrating Radar (GPR)

The unit used at this site was a Sensors and software Noggin system with a 250 MHz antenna. It consists of a housing containing transmitting and receiving antennas suspended at the ground surface by a four wheeled cart somewhat similar to a baby stroller. On the handle-bar used to push the instrument, is attached the control console, data recorder and screen. Data collection was initiated by an on-board wheel encoder which automatically collected and linked data at uniform intervals. Since this is a wheeled unit and must maintain coupling with the ground-pavement surface, it is less mobile than hand carried geophysical tools and could not be used in areas of discarded tree branches.

GPR was only used for this project on anomalous areas established by magnetic and electromagnetic methods to take advantage of GPR higher resolution to determine if targets had rounded tops, typical of tanks and pipes. An instrument self-test was initiated and passed prior to the survey.

Site Photographs

Two sets of photographs were taken, the first on October 17, 2012 by J. Ursic after the geophysical survey and the later on November 11, 2012 by a USEPA contractor when the one anomaly area was excavated.

Data Processing

Several programs and operations were used to interpolate data: Geometrics Magmap 2000 was used to transfer magnetic data to a laptop; Geonics EM61-MK2 data were downloaded using

DATTEM61-MK2 program; GEM2 data were transferred using WinGEMv3; aerial photographs were downloaded from Bing Map Images and geo-referenced to latitude and longitude using ArcMap 10. Illustrations used to show the spatial distribution of the data, and contour intervals, were created from Golden Software's Surfer 9 program using a Kriging algorithm. Final GPS values are shown using UTM Zone 16N and converted to WGS 84 decimal degrees.

Results

Magnetics (Geometrics G-858G Gradient Magnetometer)

Four figures are presented to show the results of magnetic data, Figures 3 and 4 indicate the traverses taken to collect data. Figures 6 and 7 are the contour maps and both have a contour level of 200 gammas per meter to illustrate large anomaly areas. Figures 6 and 7 are summarized as follows:

Figure 6.

Magnetic data for this figure are plotted with 200 gammas per meter contours and illustrates stronger anomalous mass details of the area. Anomalies located at the west end of the survey area are due to the metal building and interior metal objects which was approximately seven feet west of the first traverse line. Minor anomalous area near -86.16360, 41.64960 are due to the AreaRAE instrument. The anomalous areas near -86.16355, 41.64936 appear to be from unknown ferrous source.

Figure 7.

Magnetic data in this figure was collected on east-west traverses. Less anomalous areas are noted near the building since no one line is closely paralleling the building and the operator made some effort to keep some distance from the building. Anomaly near -86.16365, 41.64980 is from the corner of the metal building. Another anomaly near -86.16325, 41.64984 is due to surface scrap in the area. Anomalies from an unknown source, also seen in Figure 6, is apparent near -86.16355, 41.64936.

Frequency Domain Electromagnetic Detector (Geophex-Aeroquest GEM-2)

Figure 8 is a plot of electromagnetic conductivity, in the quadrature phase, from frequency 3,930 Hz which represents an area estimated to be approximately 6-9 feet below ground surface. The purpose of this data set is to determine if any subsurface changes in ground conductivity exists which would indicate possible contaminate plume.

Figure 8

This Figure is a plot of electromagnetic conductivities in the quadrature phase indicated by black contour lines. The orange lines show the traverses taken to obtain data and recorded using a WAAS GPS system. Note that the WAAS system is not sub-meter corrected and has additional error when compared to traverses in Figures 6 and 7. The large anomalous areas on the west side of the survey area are due to the antenna coupling into the side of the metal building up to about 12' east of the structure. Anomalous areas near -86.16360, 41.64935 appear to be in the same area as the magnetic anomalies.

Time Domain Electromagnetic Metal Detector (Geonics EM61-MK2)

This tool was not used to collect data on a systematic grid, but was used in the southern anomalous area to delineate the shape of the magnetic anomalies. Photograph numbers 4 and 66 illustrates the flagged area of anomalous area which had a rectangular shape based on data from this tool. This area appears to have significant scrap metal at the surface.

Ground Penetrating Radar (Sensors and Software Noggin system with a 250 MHz antenna)

Radar was also used over the anomalous area in an effort to determine the presence of a tank. The data was inconclusive as to the presence of a tank.

Conclusions

After this survey was completed, data were plotted on-site and draft contour maps were given to the On-Scene Coordinator (OSC). Before this final report was written the OSC, guided by recommendations from J. Ursic, a test pit was excavated in the anomalous area near -86.16360, 41.64935 to determine the source of the anomaly. Photographs 54 thru 72 document the excavation process, and no tank was found.

The magnetic anomalous areas were most likely the surface metal that was found just below the ground surface.

The electromagnetic anomaly, although it was quadrature phase data, was influenced by the mass of near surface metal and overwhelmed the instrument. The anomaly is not due to a plume but rather the surface metal.

The radar was inconclusive due to the surface metal which limited the depth radar waves propagated in the ground.

Attached to this document are site photographs taken during the day of the survey, these are photographs numbered 1 thru 73.

DISCLAIMERS & WARNINGS:

Geophysical instruments used at this site were not configured to locate utility lines, although they could be influenced by such lines under certain conditions. It is critical *not to use this data* for utility line location since methods applied were only directed towards larger sub-surface targets, other than utility lines.

It is strongly recommended that before any intrusive sampling, test pits, or other excavation methods are applied at the site, that *all* utility services be contacted to verify that none of the anomalies are the result of or near any buried utilities. Note that not all buried utilities and pipelines are members of local utility location services.

If any excavations are attempted near anomalies mentioned in this report, it is recommended that initial ground breaking be conducted outside the anomalous area and slowly moved towards the anomaly. This procedure will reduce the probability of damaging, puncturing, or disturbing the unknown source of the anomaly.

It is extremely difficult to discriminate specific sources of targets (metal scrap, etc.) based on geophysical responses since no one example can adequately describe each possible

configuration. In addition, any distortions or deteriorations of objects will also affect anomaly signatures.

Disclosure of product names in this report is not an implied or direct recommendation of the equipment used for this survey. It is only provided for its scientific value related to a specific method or tool used.

LABORATORY ANALYTICAL RESULTS AND DATA VALIDATION
REPORT**

October 4, 2012

Environmental Restoration
16660 South Canal Street
South Holland, IL 60437-

Work Order No.: 12I0947

Re: Baycote RV Mishawaka, IN

Dear John Behrens:

Microbac Laboratories, Inc. - Chicagoland Division received 2 sample(s) on 9/27/2012 10:26:00AM for the analyses presented in the following report as Work Order 12I0947.

The enclosed results were obtained from and are applicable to the sample(s) as received at the laboratory. All sample results are reported on an "as received" basis unless otherwise noted.

All data included in this report have been reviewed and meet the applicable project specific and certification specific requirements, unless otherwise noted. A qualifications page is included in this report and lists the programs under which Microbac maintains certification.

This report has been paginated in its entirety and shall not be reproduced except in full, without the written approval of Microbac Laboratories.

We appreciate the opportunity to service your analytical needs. If you have any questions, please contact your project manager. For any feedback, please contact Robert Crookston, Interim Managing Director, at robert.crookston@microbac.com. You may also contact Sean Hyde, Chief Operating Officer, at sean.hyde@microbac.com or James Nokes, President, at james.nokes@microbac.com.

Sincerely,
Microbac Laboratories, Inc.

A handwritten signature in black ink that reads "Kevin A. Falvey".

Kevin Falvey
Account Manager

WORK ORDER SAMPLE SUMMARY

Date: *Thursday, October 4, 2012*

Client: Environmental Restoration
Project: Baycote RV Mishawaka, IN
Lab Order: 12I0947

Lab Sample ID	Client Sample ID	Tag Number	Collection Date	Date Received
12I0947-01	BMF-W501-092612		09/26/2012 17:00	9/27/2012 10:26:00AM
12I0947-02	BMF-W501-092612-TCLP		09/26/2012 17:00	9/27/2012 10:26:00AM

CASE NARRATIVE

Date: *Thursday, October 4, 2012*

Client: Environmental Restoration
Project: Baycote RV Mishawaka, IN
Lab Order: 12I0947

B - the Method Blank associated with the sample contained Iron at a level above the reporting limit. This is considered insignificant, as the concentration in the sample was more than ten-times that measured in the blank.

B - the Method Blank associated with the BMF-W501-092612 sample contained Chromium at a level above the reporting limit. This is considered insignificant, as the concentration in the sample was more than ten-times that measured in the blank.

The Matrix Spike and Matrix Spike Duplicate performed on the BMF-W501-092612 sample failed the accuracy and precision criteria for Cadmium, Chromium, Cobalt, and Zinc with a low bias. This bias is due to the high indigenous analyte concentration (relative to the spike amount).

The Matrix Spike and Matrix Spike Duplicate performed on the BMF-W501-092612 sample failed the accuracy criteria for Copper and Nickel with a high bias. The precision criteria were met. A Post Digestion Spike was performed and the acceptance criteria met, indicating accurate measurement at the instrument. This data is indicative of matrix interference at the preparation level. The Matrix Spike and Matrix Spike Duplicate failed the accuracy criteria for Vanadium with a low bias. The precision criteria were met. A Post Digestion Spike was performed and the acceptance criteria were not met, indicating sample matrix interference.

FLAGS, FOOTNOTES AND ABBREVIATIONS (as needed)

B = Detected in the associated method Blank at a concentration above the routine RL
b = Detected in the associated method Blank at a concentration greater than 2.2 times the MDL
b* = Detected in the associated method Blank at a concentration greater than half the RL
CFU = Colony forming units
D = Dilution performed on sample
DF = Dilution Factor
g = Gram
E = Value above quantitation range
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference
J = Analyte concentration detected between RL and MDL (Metals / Organics)
LOD = Limit of Detection
m3 = Meters cubed
MDL = Method Detection Limit
mg/Kg = Milligrams per Kilogram (ppm)
mg/L = Milligrams per Liter (ppm)
NA = Not Analyzed
ND = Not Detected at the Reporting Limit (or the Method Detection Limit, if used)
NR = Not Recovered
R = RPD outside accepted recovery limits
RL = Reporting Limit
S = Spike recovery outside recovery limits
Surr = Surrogate
U = Undetected
> = Greater than
< = Less than
% = Percent

ANALYTE TYPES: (AT)

A,B = Target Analyte
I = Internal Standard
M = Summation Analyte
S = Surrogate
T = Tentatively Identified Compound (TIC, concentration estimated)

QC SAMPLE IDENTIFICATIONS

BLK = Method Blank	ICSA = Interference Check Standard "A"
DUP = Method Duplicate	ICSAB = Interference Check Standard "AB"
BS = Method Blank Spike	BSD = Method Blank Spike Duplicate
MS = Matrix Spike	MSD = Matrix Spike Duplicate
ICB = Initial Calibration Blank	ICV = Initial Calibration Verification
CCB = Continuing Calibration Blank	CCV = Continuing Calibration Verification
CRL = Client Required Reporting Limit	OPR = Ongoing Precision and Recovery Standard
PDS = Post Digestion Spike	SD = Serial Dilution
QCS = Quality Control Standard	

CERTIFICATIONS

Below is a list of certifications maintained by the Microbac Merrillville Laboratory. All data included in this report has been reviewed for and meets all project specific and quality control requirements of the applicable accreditation, unless otherwise noted. Complete lists of individual analytes pursuant to each certification below are available upon request.

- ^a The American Association for Laboratory Accreditation [A2LA] for Biological Testing, ISO/IEC 17025 (Certificate# 3045.01)
- ^b The American Association for Laboratory Accreditation [A2LA] for Environmental Department of Defense Testing, ISO/IEC 17025 (Certificate# 3045.02)
- ^c Illinois EPA for the analysis wastewater and solid waste in accordance with the requirements of the National Environmental Laboratory Accreditation Program [NELAP] (accreditation #200064)
- ^d Illinois Department of Public Health for the microbiological analysis of drinking water (registry #1755266)
- ^e Indiana DEM approved support laboratory for solid waste and wastewater analyses
- ^f Indiana SDH for the chemical analysis of drinking water (lab #C-45-03)
- ^f Indiana SDH for the microbiological analysis of drinking water (lab #M-45-8)
- ^g Kansas Department of Health and Environment for the analysis of drinking water, wastewater, and solid hazardous waste in accordance with the requirements of the National Environmental Laboratory Accreditation Program [NELAP] (Certificate No. E-10397)
- ^h Kentucky EPPC for the analysis of samples applicable to the Underground Storage Tank program (lab #75)
- ⁱ North Carolina DENR for the environmental analysis for NPDES effluent, surface water, groundwater, and pretreatment regulations(certification #597)
- ^j Pennsylvania Department of Environmental Protection (Registration No.: 68-04863)
- ^j Wisconsin DNR for the chemical analysis of wastewater and solid waste (lab #998036710)

**BAYCOTE METAL FINISHING
MISHIWAKA, INDIANA
DATA VALIDATION REPORT**

Date: October 5, 2012

Laboratory: Microbac Laboratories, Inc. (Microbac), Merrillville, Indiana

Laboratory Project #: 12I0947

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Work Order #: 20405.012.001.1843.00

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for one solid sample collected for the Baycote Metal Finishing Site that was analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Metals by SW-846 Methods 6010B, 6020A, and 7471A
- Toxicity Characteristic Leaching Procedure (TCLP) Metals by SW-846 Methods 1311, 6010B, and 7470A
- Hexavalent Chromium by SW-846 Method 7196A
- Total Cyanide by SW-846 Method 9012B
- Reactive Cyanide by SW-846 Method 7.3.3.2

A level II data package was requested from Microbac. The data validation was conducted in general accordance with the U.S. EPA “Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review” dated January 2010. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TOTAL METALS BY SW-846 METHODS 6010B, 6020A, AND 7471A

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-WS01-092612	12I0947-01	Solid	9/26/2012	9/28/2012 – 10/2/2012

2. Holding Times

The sample was analyzed within the required holding time limit of 28 days from sample collection to analysis for mercury and 180 days from sample collection to analysis for all other metals.

3. Blank Results

Method blanks were analyzed with the metals analysis. The blanks were free of target analyte contamination above the reporting limits except for iron, chromium, and selenium. Iron and chromium were detected at much higher concentrations in the sample than in the blank and no qualifications were required. The detected selenium result was flagged “U” as not detected because it was detected at a similar concentration as the blank.

4. Laboratory Control Sample (LCS) Results

The LCS recoveries were within the laboratory-established quality control (QC) limits for target analytes.

5. MS and MSD Results

Microbac analyzed site-specific MS and MSDs for the metals analysis. The percent recoveries and relative percent difference (RPD) were within QC limits except for as follows.

Some of the metals could not be adequately recovered because the spike amount was much less (more than four times less) than the sample concentrations. No qualifications are required in these instances.

The exceptions were copper, silver, and nickel. These metal results were flagged “J” as estimated due to matrix interference.

6. Overall Assessment

The metals data are acceptable for use as qualified based on the information received.

TCLP METALS BY SW-846 METHODS 1311, 6020, AND 7470A

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-WS01-092612	12I0947-02	Solid	9/26/2012	10/1/2012

2. Holding Times

The sample was analyzed within the required holding time limit of 28 days from sample collection to analysis for mercury and 180 days from sample collection to analysis for all other metals.

3. Blank Results

Method blanks were analyzed with the metals analysis. The blanks were free of target analyte contamination above the reporting limits.

4. LCS Results

The LCS recoveries were within the laboratory-established QC limits for target analytes.

5. MS and MSD Results

Microbac did not analyze site-specific MS and MSDs. No qualifications are required.

6. Overall Assessment

The TCLP metals data are acceptable for use based on the information received.

GENERAL CHEMISTRY PARAMETERS (Hexavalent Chromium by 7196A, Total Cyanide by 9012B, and Reactive Cyanide by 7.3.3.2)

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-WS01-092612	12I0947-01	Solid	9/26/2012	10/3/2012 – 10/4/2012

2. Holding Times

The holding times were acceptable for all analyses.

3. Method Blanks

Method blanks were analyzed with the total cyanide, reactive cyanide, and hexavalent chromium analyses. The blanks were free of target analyte contamination above the reporting limits.

4. LCS Results

The percent recoveries and relative percent differences were within laboratory-established QC limits for all LCS and LCS duplicates analyzed.

6. MS and MSD Results

A site-specific MS and MSD were analyzed with the hexavalent chromium analysis only. The percent recovery for the MSD was within QC limits; however, the percent recovery for the MS was very low. In addition, the RPD was outside QC limits. The quantitation limits for the non-detected hexavalent chromium result was flagged “UJ” as estimated due to potential matrix interferences.

7. Overall Assessment

The hexavalent chromium, total cyanide, and reactive cyanide data are acceptable for use as qualified based on the information received.

FLAGS, FOOTNOTES AND ABBREVIATIONS (as needed)

B = Detected in the associated method Blank at a concentration above the routine RL
b = Detected in the associated method Blank at a concentration greater than 2.2 times the MDL
b* = Detected in the associated method Blank at a concentration greater than half the RL
CFU = Colony forming units
D = Dilution performed on sample
DF = Dilution Factor
g = Gram
E = Value above quantitation range
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference
J = Analyte concentration detected between RL and MDL (Metals / Organics)
LOD = Limit of Detection
m3 = Meters cubed
MDL = Method Detection Limit
mg/Kg = Milligrams per Kilogram (ppm)
mg/L = Milligrams per Liter (ppm)
NA = Not Analyzed
ND = Not Detected at the Reporting Limit (or the Method Detection Limit, if used)
NR = Not Recovered
R = RPD outside accepted recovery limits
RL = Reporting Limit
S = Spike recovery outside recovery limits
Surr = Surrogate
U = Undetected
> = Greater than
< = Less than
% = Percent

ANALYTE TYPES: (AT)

A,B = Target Analyte
I = Internal Standard
M = Summation Analyte
S = Surrogate
T = Tentatively Identified Compound (TIC, concentration estimated)

QC SAMPLE IDENTIFICATIONS

BLK = Method Blank	ICSA = Interference Check Standard "A"
DUP = Method Duplicate	ICSAB = Interference Check Standard "AB"
BS = Method Blank Spike	BSD = Method Blank Spike Duplicate
MS = Matrix Spike	MSD = Matrix Spike Duplicate
ICB = Initial Calibration Blank	ICV = Initial Calibration Verification
CCB = Continuing Calibration Blank	CCV = Continuing Calibration Verification
CRL = Client Required Reporting Limit	OPR = Ongoing Precision and Recovery Standard
PDS = Post Digestion Spike	SD = Serial Dilution
QCS = Quality Control Standard	

CERTIFICATIONS

Below is a list of certifications maintained by the Microbac Merrillville Laboratory. All data included in this report has been reviewed for and meets all project specific and quality control requirements of the applicable accreditation, unless otherwise noted. Complete lists of individual analytes pursuant to each certification below are available upon request.

- ^a The American Association for Laboratory Accreditation [A2LA] for Biological Testing, ISO/IEC 17025 (Certificate# 3045.01)
- ^b The American Association for Laboratory Accreditation [A2LA] for Environmental Department of Defense Testing, ISO/IEC 17025 (Certificate# 3045.02)
- ^c Illinois EPA for the analysis wastewater and solid waste in accordance with the requirements of the National Environmental Laboratory Accreditation Program [NELAP] (accreditation #200064)
- ^d Illinois Department of Public Health for the microbiological analysis of drinking water (registry #1755266)
- ^e Indiana DEM approved support laboratory for solid waste and wastewater analyses
- ^f Indiana SDH for the chemical analysis of drinking water (lab #C-45-03)
- ^f Indiana SDH for the microbiological analysis of drinking water (lab #M-45-8)
- ^g Kansas Department of Health and Environment for the analysis of drinking water, wastewater, and solid hazardous waste in accordance with the requirements of the National Environmental Laboratory Accreditation Program [NELAP] (Certificate No. E-10397)
- ^h Kentucky EPPC for the analysis of samples applicable to the Underground Storage Tank program (lab #75)
- ⁱ North Carolina DENR for the environmental analysis for NPDES effluent, surface water, groundwater, and pretreatment regulations(certificate #597)
- ^j Pennsylvania Department of Environmental Protection (Registration No.: 68-04863)
- ^j Wisconsin DNR for the chemical analysis of wastewater and solid waste (lab #998036710)

RE: Project: Baycote Metal Finishings
Pace Project No.: 5071213

Dear Mr. Behrens:

Enclosed are the analytical results for sample(s) received by the laboratory on October 24, 2012. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kenneth Hunt

QUALIFIERS

Project: Baycote Metal Finishings
Pace Project No.: 5071213

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-I Pace Analytical Services - Indianapolis

PASI-K Pace Analytical Services - Kansas City

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.

M3 Matrix spike recovery was outside laboratory control limits due to matrix interferences.

R1 RPD value was outside control limits.

S0 Surrogate recovery outside laboratory control limits.

**BAYCOTE METAL FINISHING
MISHIWAKA, INDIANA
DATA VALIDATION REPORT**

Date: November 2, 2012

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5071213

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Work Order #: 20405.012.001.1843.00

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for six solid samples collected for the Baycote Metal Finishing Removal Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Toxicity Characteristic Leaching Procedures (TCLP) Volatile Organic Compounds (VOC) by SW-846 Methods 1311 and 8260
- TCLP Semivolatile Organic Carbons (SVOC) by SW-846 Methods 1311 and 8270
- Polychlorinated Biphenyls (PCB) by SW-846 Method 8082
- Metals by SW-846 Methods 6010 and 7471
- TCLP Metals by SW-846 Methods 1311, 6010, and 7470
- Hexavalent Chromium by SW-846 Method 7196A
- Total Cyanide by SW-846 Method 9012
- Reactive Cyanide by SW-846 Method 7.3.3.2

A level II data package was requested from STAT. The data validation was conducted in general accordance with the U.S. EPA "Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review" dated June 2008 and "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review" dated January 2010. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TCLP VOCs by SW-846 METHODS 1311 AND 8260

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-S01-102212	5071213001	Solid	10/22/2012	10/27/2012
BMF-S02-102212	5071213002	Solid	10/22/2012	10/27/2012
BMF-S03-102212	5071213003	Solid	10/22/2012	10/27/2012
BMF-S03-102212D	5071213004	Solid	10/22/2012	10/27/2012
BMF-S04-102212	5071213005	Solid	10/22/2012	10/27/2012
BMF-S05-102212	5071213006	Solid	10/22/2012	10/27/2012

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection.

3. Blanks

Method blanks were analyzed with the VOC analyses. The method blanks were free of target compound contamination above the reporting limit.

4. Surrogate Results

The surrogate recovery results were within the laboratory-established quality control (QC) limits.

5. Laboratory Control Sample (LCS) Results

The LCS recoveries were within laboratory QC limits.

6. Matrix Spike (MS) Results

Site-specific MS samples were analyzed. The percent recoveries were within QC limits.

7. Field Duplicate Results

Sample BMF-S03-102212D is a field duplicate of sample BMF-S03-102212. All results were non-detect in both samples indicating good correlation between the samples.

8. Overall Assessment

The VOC data are acceptable for use based on the information received.

TCLP SVOCs BY SW-846 METHODS 1311 AND 8270

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Prepared	Date Analyzed
BMF-S01-102212	5071213001	Solid	10/22/2012	10/29/2012	10/31/2012
BMF-S02-102212	5071213002	Solid	10/22/2012	10/31/2012	10/31/2012
BMF-S03-102212	5071213003	Solid	10/22/2012	10/29/2012	10/30/2012
BMF-S03-102212D	5071213004	Solid	10/22/2012	10/29/2012	10/30/2012
BMF-S04-102212	5071213005	Solid	10/22/2012	10/29/2012	10/30/2012
BMF-S05-102212	5071213006	Solid	10/22/2012	10/29/2012	10/30/2012

2. Holding Times

The samples were analyzed within the required holding time limit of 14 days from sample collection to extraction and 40 days from extraction to analysis.

3. Blanks

Method blanks were analyzed with the SVOC analyses. The method blanks were free of target compound contamination above the reporting limits.

4. Surrogate Results

The surrogate recoveries were within the laboratory-established QC limits.

5. LCS Results

The percent recoveries for the LCS results were within the laboratory-established QC limits.

6. MS and Matrix Spike Duplicate (MSD) Results

A site-specific MS and MSD were not analyzed. No qualifications are required.

7. **Field Duplicate Results**

Sample BMF-S03-102212D is a field duplicate of sample BMF-S03-102212. All results were non-detect for SVOCs in both samples indicating good correlation between the samples.

8. **Overall Assessment**

The SVOC data are acceptable for use based on the information received.

PCBs BY U.S. EPA SW-846 METHOD 8082

1. **Samples**

The following table summarizes the samples for which this data validation was conducted.

Samples	Lab ID	Matrix	Date Collected	Date Prepared	Date Analyzed
BMF-S01-102212	5071213001	Solid	10/22/2012	10/25/2012	10/25/2012

BMF-S04-102212	5071213005	Solid	10/22/2012	10/29/2012	10/29/2012
BMF-S05-102212	5071213006	Solid	10/22/2012	10/25/2012	10/25/2012

2. **Holding Times**

The samples were analyzed within the required holding time limit of 14 days from sample collection to extraction and 40 days from extraction to analysis.

3. **Blanks**

Method blanks were analyzed with the PCB analyses. The method blanks were free of target compound contamination above the reporting limit.

4. **Surrogates**

The surrogate recoveries were within QC limits.

5. **LCS Results**

The LCS recoveries were within the laboratory-established QC limits.

6. **MS and MSD Results**

A site-specific MS and MSD were analyzed. The percent recoveries and RPDs were within QC limits.

7. **Field Duplicate Results**

Sample BMF-S03-102212D is a field duplicate of sample BMF-S03-102212. All results were non-detect for PCBs in both samples indicating good correlation between the samples.

8. **Overall Assessment**

The PCB data are acceptable for use based on the information received.

TOTAL METALS BY SW-846 METHODS 6010 AND 7471

1. **Samples**

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-S01-102212	5071213001	Solid	10/22/2012	10/26/2012 – 10/30/2012
BMF-S02-102212	5071213002	Solid	10/22/2012	10/26/2012 – 10/30/2012
BMF-S03-102212	5071213003	Solid	10/22/2012	10/26/2012 – 10/30/2012
BMF-S03-102212D	5071213004	Solid	10/22/2012	10/26/2012 – 10/30/2012
BMF-S04-102212	5071213005	Solid	10/22/2012	10/26/2012 – 10/30/2012
BMF-S05-102212	5071213006	Solid	10/22/2012	10/26/2012 – 10/30/2012

2. **Holding Times**

The samples were analyzed within the required holding time limit of 28 days from sample collection to analysis for mercury and 180 days from sample collection to analysis for all other metals.

3. Blank Results

Method blanks were analyzed with the metals analysis. The blanks were free of target analyte contamination above the reporting limits.

4. LCS Results

The LCS recoveries were within the laboratory-established QC limits for target analytes.

5. MS and MSD Results

A site-specific MS and MSD were analyzed for the metals analysis. The percent recoveries and RPDs were within QC limits.

6. Field Duplicate Results

Sample BMF-S03-102212D is a field duplicate of sample BMF-S03-102212. All results were non-detect for PCBs in both samples indicating good correlation between the samples.

The RPDs for detected metals ranged from 3 to 77 percent. The RPDs were acceptable except for chromium which had an RPD of 77, above a standard QC limit of 50 RPD. There appears to be minor heterogeneity associated with chromium in these samples. No qualifications were applied.

7. Overall Assessment

The metals data are acceptable for use based on the information received.

TCLP METALS BY SW-846 METHODS 1311, 6010, AND 7470

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-S01-102212	5071213001	Solid	10/22/2012	10/30/2012 – 10/31/2012
BMF-S02-102212	5071213002	Solid	10/22/2012	10/30/2012 – 10/31/2012
BMF-S03-102212	5071213003	Solid	10/22/2012	10/30/2012 – 10/31/2012
BMF-S03-102212D	5071213004	Solid	10/22/2012	10/30/2012 – 10/31/2012
BMF-S04-102212	5071213005	Solid	10/22/2012	10/30/2012 – 10/31/2012
BMF-S05-102212	5071213006	Solid	10/22/2012	10/30/2012 – 10/31/2012

2. Holding Times

The samples were analyzed within the required holding time limit of 28 days from sample collection to analysis for mercury and 180 days from sample collection to analysis for all other metals.

3. Blank Results

Method blanks were analyzed with the metals analysis. The blanks were free of target analyte contamination above the reporting limits.

4. LCS Results

The LCS and LCS duplicate recoveries and RPDs were within the laboratory-established QC limits for target analytes.

5. MS and MSD Results

A site-specific MS was analyzed and recoveries were within QC limits.

6. Field Duplicate Results

Sample BMF-S03-102212D is a field duplicate of sample BMF-S03-102212. All results were non-detect for TCLP metals in both samples indicating good correlation between the samples.

7. Overall Assessment

The TCLP metals data are acceptable for use based on the information received.

GENERAL CHEMISTRY PARAMETERS (Hexavalent Chromium by 7196A, Total Cyanide by 9012, and Reactive Cyanide by 7.3.3.2)

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-S01-102212	5071213001	Solid	10/22/2012	10/26/2012 – 10/29/2012
BMF-S02-102212	5071213002	Solid	10/22/2012	10/26/2012 – 10/29/2012
BMF-S03-102212	5071213003	Solid	10/22/2012	10/26/2012 – 10/29/2012
BMF-S03-102212D	5071213004	Solid	10/22/2012	10/26/2012 – 10/29/2012
BMF-S04-102212	5071213005	Solid	10/22/2012	10/26/2012 – 10/29/2012
BMF-S05-102212	5071213006	Solid	10/22/2012	10/26/2012 – 10/29/2012

2. Holding Times

The holding times were acceptable for all analyses.

3. Method Blanks

Method blanks were analyzed and were free of target analyte contamination above the reporting limits.

4. LCS Results

The percent recoveries were within QC limits for all LCSs analyzed.

5. Laboratory Duplicate Results

Laboratory duplicates had acceptable results.

Data Validation Report
Baycote Metal Finishing Site
Pace Analytical Services, Inc.
Laboratory Project #: 5071213

6. MS and MSD Results

Site-specific MS and MSDs were analyzed. The recoveries and RPDs were acceptable except for as follows. For hexavalent chromium the percent recoveries were very low. The quantitation limits for the non-detected hexavalent chromium analyses were flagged "UJ" as estimated due to apparent matrix interferences.

7. Field Duplicate Results

Sample BMF-S03-102212D is a field duplicate of sample BMF-S03-102212. All results were non-detect except for total cyanide in the field duplicate which had a result of 0.72 milligram per kilogram which was near the reporting limit. Total cyanide was not detected in the parent sample. No qualifications were applied.

8. Overall Assessment

The hexavalent chromium, total cyanide, and reactive cyanide data are acceptable for use as qualified based on the information received.

RE: Project: Baycote Metal Finishings
Pace Project No.: 5071481

Dear Mr. Behrens:

Enclosed are the analytical results for sample(s) received by the laboratory on October 30, 2012. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kenneth Hunt

QUALIFIERS

Project: Baycote Metal Finishings
Pace Project No.: 5071481

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-I Pace Analytical Services - Indianapolis

PASI-K Pace Analytical Services - Kansas City

ANALYTE QUALIFIERS

1d RPD value was outside control limits due to non-homogeneity of the analyte in the sample matrix.

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

E Analyte concentration exceeded the calibration range. The reported result is estimated.

H1 Analysis conducted outside the EPA method holding time.

H6 Analysis initiated outside of the 15 minute EPA recommended holding time.

M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.

M3 Matrix spike recovery was outside laboratory control limits due to matrix interferences.

P6 Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.

R2 RPD value was outside control limits due to matrix interference

**BAYCOTE METAL FINISHING
MISHIWAKA, INDIANA
DATA VALIDATION REPORT**

Date: November 9, 2012

Laboratory: Pace Analytical Services, Inc. (Pace), Indianapolis, Indiana

Laboratory Project #: 5071481

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON) Superfund Technical Assessment and Response Team (START)

Weston Work Order #: 20405.012.001.1843.00

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for six water and six solid samples collected for the Baycote Metal Finishing Removal Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Metals by SW-846 Methods 6010 and 7471
- Toxicity Characteristic Leaching Procedures (TCLP) Metals by SW-846 Methods 1311, 6010, and 7470
- Total Cyanide by SW-846 Method 9012
- Reactive Cyanide by SW-846 Method 7.3.3.2
- Hexavalent Chromium by SW-846 Method 7196A
- Flashpoint by SW-846 Method 1010
- pH by Standard Method (SM) 4500-H B and ASTM D2974

A level II data package was requested from STAT. The data validation was conducted in general accordance with the U.S. EPA "Contract Laboratory Program National Functional Guidance for Superfund Organic Methods Data Review" dated June 2008 and "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review" dated January 2010. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TOTAL METALS BY SW-846 METHODS 6010 AND 7471

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-WL01-102912	5071481001	Water	10/29/2012	11/2/2012
BMF-WL01-102912D	5071481002	Water	10/29/2012	11/2/2012
BMF-WL02-102912	5071481003	Water	10/29/2012	11/2/2012
BMF-WL03-102912	5071481004	Water	10/29/2012	11/2/2012
BMF-WL04-102912	5071481005	Water	10/29/2012	11/2/2012
BMF-WL05-102912	5071481006	Water	10/29/2012	11/2/2012
BMF-WS01-102912	5071481007	Solid	10/29/2012	11/5/2012 – 11/6/2012
BMF-WS01-102912D	5071481008	Solid	10/29/2012	11/5/2012 – 11/6/2012
BMF-WS02-102912	5071481009	Solid	10/29/2012	11/5/2012 – 11/6/2012
BMF-WS03-102912	5071481010	Solid	10/29/2012	11/5/2012 – 11/6/2012
BMF-WS04-102912	5071481011	Solid	10/29/2012	11/5/2012 – 11/6/2012
BMF-WS05-102912	5071481012	Solid	10/29/2012	11/5/2012 – 11/6/2012

2. Holding Times

The samples were analyzed within the required holding time limit of 28 days from sample collection to analysis for mercury and 180 days from sample collection to analysis for all other metals.

3. Blank Results

Method blanks were analyzed with the metals analysis. The blanks were free of target analyte contamination above the reporting limits.

4. LCS Results

The LCS recoveries were within the laboratory-established QC limits for target analytes.

5. MS and MSD Results

Site-specific MS and MSDs were analyzed for the metals analysis. The percent recoveries and RPDs were within QC limits except for as follows.

In some instances, the sample concentration was more than four times the spike amount and the spike was not adequately recovered. No qualifications are required in these instances.

For the spike of sample BMF-WS01-102912, one of the recoveries was low and one of the recoveries was high for mercury. In this sample, the mercury result was flagged “J” as estimated due to potential matrix interference.

6. Field Duplicate Results

There are two field duplicates in this work order identified with a “D” suffix in the sample name. The RPDs were calculated for detected metals and were acceptable. There were two instances where a metal was not detected in one sample but then was detected in the duplicate sample slightly above the QC limit. In general the field duplicate results were acceptable.

7. Overall Assessment

The metals data are acceptable for use based on the information received.

TCLP METALS BY SW-846 METHODS 1311, 6010, AND 7470

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-WS01-102912	5071481007	Solid	10/29/2012	11/2/2012 – 11/5/2012
BMF-WS01-102912D	5071481008	Solid	10/29/2012	11/2/2012 – 11/5/2012
BMF-WS02-102912	5071481009	Solid	10/29/2012	11/2/2012 – 11/5/2012
BMF-WS03-102912	5071481010	Solid	10/29/2012	11/2/2012 – 11/5/2012
BMF-WS04-102912	5071481011	Solid	10/29/2012	11/2/2012 – 11/5/2012
BMF-WS05-102912	5071481012	Solid	10/29/2012	11/2/2012 – 11/5/2012

2. Holding Times

The samples were analyzed within the required holding time limit of 28 days from sample collection to analysis for mercury and 180 days from sample collection to analysis for all other metals.

3. Blank Results

Method blanks were analyzed with the metals analysis. The blanks were free of target analyte contamination above the reporting limits.

4. LCS Results

The LCS and LCS duplicate recoveries and RPDs were within the laboratory-established QC limits for target analytes.

5. MS and MSD Results

A site-specific MS was analyzed and recoveries were within QC limits.

6. Field Duplicate Results

Sample BMF-WS01-102912D is a field duplicate of sample BMF-WS01-102912. The RPDs for detected metals were below a standard QC limit of 50 except for TCLP cadmium which had an RPD of 155. There is sample heterogeneity associated with TCLP cadmium in this sample. No qualifications are applied.

7. Overall Assessment

The TCLP metals data are acceptable for use based on the information received.

GENERAL CHEMISTRY PARAMETERS (Hexavalent Chromium by 7196A, Total Cyanide by 9012, Reactive Cyanide by 7.3.3.2, Flashpoint by SW-846 Method 1010, and pH by SM 4500-H B and ASTM D2974)

1. Samples

The following table summarizes the samples for which this data validation is being conducted. Note that the solid samples were not analyzed for pH and flashpoint.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BMF-WL01-102912	5071481001	Water	10/29/2012	10/30/2012 – 11/6/2012
BMF-WL01-102912D	5071481002	Water	10/29/2012	10/30/2012 – 11/6/2012
BMF-WL02-102912	5071481003	Water	10/29/2012	10/30/2012 – 11/6/2012
BMF-WL03-102912	5071481004	Water	10/29/2012	10/30/2012 – 11/6/2012
BMF-WL04-102912	5071481005	Water	10/29/2012	10/30/2012 – 11/6/2012
BMF-WL05-102912	5071481006	Water	10/29/2012	10/30/2012 – 11/6/2012
BMF-WS01-102912	5071481007	Solid	10/29/2012	11/1/2012 – 11/5/2012
BMF-WS01-102912D	5071481008	Solid	10/29/2012	11/1/2012 – 11/5/2012
BMF-WS02-102912	5071481009	Solid	10/29/2012	11/1/2012 – 11/5/2012
BMF-WS03-102912	5071481010	Solid	10/29/2012	11/1/2012 – 11/5/2012
BMF-WS04-102912	5071481011	Solid	10/29/2012	11/1/2012 – 11/5/2012
BMF-WS05-102912	5071481012	Solid	10/29/2012	11/1/2012 – 11/5/2012

2. Holding Times

The holding times were acceptable for all analyses.

3. Method Blanks

Method blanks were analyzed and were free of target analyte contamination above the reporting limits.

4. LCS Results

The percent recoveries were within QC limits for all LCSs analyzed.

5. Laboratory Duplicate Results

Laboratory duplicates had acceptable results.

6. MS and MSD Results

Site-specific MS and MSDs were analyzed. The recoveries and RPDs were acceptable except for as follows.

For the cyanide MS/MSD for solid samples, the sample concentration was more than four times the spike amount and the spike was not adequately recovered. No qualifications are required in these instances.

For hexavalent chromium in the solid MS/MSD, the percent recoveries were very low. In solid samples, the detected results were flagged “J” and the quantitation limits for the non-detected hexavalent chromium results were flagged “UJ” as estimated due to apparent matrix interferences. The water MS/MSD for hexavalent chromium had recoveries within QC limits.

7. Field Duplicate Results

There are two field duplicates in this work order identified with a “D” suffix in the sample name. The RPDs were calculated and were acceptable except for total cyanide in field duplicate BMF-WS01-102912D. There is apparent sample heterogeneity associated with total cyanide in this solid sample.

8. Overall Assessment

The hexavalent chromium, total cyanide, reactive cyanide, flashpoint, and pH data are acceptable for use as qualified based on the information received.

ANALYTICAL RESULTS

Project: Baycote Metal Finishings
Pace Project No.: 5071481

Sample: BMF-WS05-102912 Lab ID: 5071481012 Collected: 10/29/12 10:40 Received: 10/30/12 08:07 Matrix: Solid

Results reported on a "wet-weight" basis

Parameters	Results	Units	Report Limit	DF	Prepared	Analyzed	CAS No.	Qual
6010 MET ICP		Analytical Method: EPA 6010 Preparation Method: EPA 3050						
Arsenic	4.8	mg/kg	1.9	1	11/02/12 14:52	11/05/12 22:23	7440-38-2
