Executive Summary

ENVIRON International Corporation (ENVIRON) was retained by the Genuine Parts Company (Genuine Parts) to continue remediation of volatile organic compound (VOC) groundwater contamination at the former General Motors Corporation, Allison Gas Turbine Division (AGT) Plant 10 in Indianapolis, Indiana (Site). Regulatory closure of the Site is being administered through the Indiana Department of Environmental Management (IDEM) Voluntary Remediation Program (VRP) under Site number 6991004. This report summarizes remedial progress based on the results of semi-annual groundwater sampling conducted in February and September of 2011. Also summarized in this report are the findings of a July 2011 monitoring well nest installation voluntarily undertaken by Genuine Parts to confirm the western edge of the VOC groundwater plume on the Michigan Meadows Apartments property down-gradient south of the Site.

On-Site Remedial Progress

On-site remedial objectives, the VRP Tier II Non-Residential Cleanup Goals, have been essentially achieved. Concentrations of vinyl chloride (VC) in the Western Source Area (WSA) and trichloroethene (TCE) in the Eastern Source Area (ESA) occasionally fluctuate above and below their respective Tier II Cleanup Goals. Some rebound of TCE groundwater concentrations has been observed in the ESA since the remediation system was turned off in 2006. Continued monitoring in the ESA will be performed to evaluate whether additional remedial efforts are needed in this area. The Southwest Air Sparge/Soil Vapor Extraction (AS/SVE) Remediation System was turned off in June of 2010. No rebound of groundwater concentrations has been observed in this area and continued monitoring will be performed. Monitoring well IW-2 in the East Bioremediation Source Area exhibited a markedly increased perchloroethene (tetrachloroethene) (PCE) concentration in February 2011. IW-2 will be sampled during the next sampling event to further evaluate remedial progress in this area.

Off-Site Remedial Progress

The off-site groundwater plumes from both the WSA and ESA are stable and, in response, the IDEM approved a reduced groundwater monitoring program in May 2011. VOCs were not detected in excess of off-Site remedial objectives, the VRP Tier II Residential Cleanup Goals, in groundwater samples collected from new monitoring well nests installed along Holt Road west of the Michigan Meadows Apartments. This confirms the western edge of the groundwater plume is delineated and no further investigation is needed.

1 Introduction

ENVIRON International Corporation (ENVIRON) was retained by the Genuine Parts Company (Genuine Parts) to continue remediation of volatile organic compound (VOC) groundwater contamination at the former General Motors Corporation, Allison Gas Turbine Division (AGT) Plant 10 in Indianapolis, Indiana (Site). Regulatory closure of the Site is being administered through the Indiana Department of Environmental Management (IDEM) Voluntary Remediation Program (VRP) under Site number 6991004. This report summarizes remedial progress based on the results of semi-annual groundwater sampling conducted in February and September of 2011. Also summarized in this report are the findings of a July 2011 monitoring well nest installation voluntarily undertaken by Genuine Parts to confirm the western edge of the VOC groundwater plume on the Michigan Meadows Apartments property down-gradient south of the Site.

2 Site Background

The Site is located at 700 North Olin Avenue, Indianapolis, Marion County, Indiana (Figure 1) and is the former General Motors Corporation, Allison Gas Turbine Division (AGT) Plant 10. Between 1956 and 1973, BHT Corporation (BHT) operated the facility for carburetor and brake re-manufacturing. General Motors purchased the property from BHT in 1973 and used the facility for warehousing obsolete machines, tooling, and fixtures until the mid-1980s, at which time the property became part of the AGT Division. BHT became part of Genuine Parts, through acquisition and merger, subsequent to the sale of the property to General Motors. AGT continued to use the facility for warehousing until December 1993 when the property was sold to the Allison Engine Company (AEC). AEC sold the facility to Associated Properties, Inc. in 1998. Associated Properties, Inc. sold the facility to the current property owner, American Art Clay Company, Inc., in 2002.

Sources of Contamination

Two source areas were identified at the Site during extensive characterization activities: (1) an eastern source area (ESA) associated with former solvent use, and (2) a western source area (WSA) associated with historic degreasing and industrial waste burial activities. A small anomalous area of TCE occurrence in groundwater was also noted to the east of the Site at the intersection of Olin Avenue and Walnut Street. This area is referred to as the East Bioremediation Source Area (EBSA). A complete summary of on- and off-site investigation activities is provided in Section 4.0 of the Final Remediation Work Plan (RWP) (KERAMIDA, 2004).

Chemicals of concern (COC)

COC identified at the Site include VOCs, polynuclear aromatic hydrocarbons (PAH), cadmium, chromium, and lead. The primary VOCs that require remediation include TCE and daughter products cis-1,2-dichloroethene (cDCE) and vinyl chloride (VC).

Cleanup Criteria

VRP Tier II Non-Residential Cleanup Goals (NRCGs) are the cleanup criteria for on-Site soils and groundwater (Section 6.0 of Final RWP). As approved in the March 2005 IDEM Modified RWP Approval letter, VRP Tier II Residential Cleanup Goals (RCGs) are the cleanup criteria for VOC in off-site groundwater attributable to the Site. There are other off-Site contributing sources to the off-Site groundwater plume.

In recognition that achieving groundwater RCGs off-Site was not likely because of the presence of off-Site sources, the IDEM RWP Approval letter contemplated the viability of an exposure prevention remedy through demonstration of plume stability as an alternate closure criterion. The technical basis for this approach considered:

- potable water is provided to the area by a municipal water supply
- the Site and surrounding area is in a Marion County No Well Zone that prohibits the installation of water supply wells

The seven year plume stability demonstration was successfully completed and documented in the March 15, 2011 Remedial Progress Report. In the May 26, 2011 IDEM letter response to the progress report, IDEM confirmed that the No Well Zone was an acceptable institutional control (IC) for exposure prevention provided that exposure control for pre-existing wells in the No Well Zone is effectively implemented over the life of the plume.

Groundwater cleanup goals protective of the vapor intrusion pathway were calculated for the anomalous area of TCE occurrence east of the Site near the intersection of Olin Avenue and Walnut Street. A level of 1,800 micrograms per liter (µg/L) was calculated for TCE, 104,000 µg/L for C 1,2 DCE, and 198 µg/L for VC. Documentation on the calculation of these cleanup goals is provided in the June 10, 2005 Bioremediation Report prepared by KERAMIDA for the Site.

Modified Groundwater Monitoring Program

Based upon the plume stability demonstration, a reduced groundwater monitoring plan was proposed and accepted with minor modification by the IDEM in the May 26, 2011 letter response. The approved changes to the groundwater monitoring plan include:

- Discontinued monitoring of the following WSA wells:
  - On-Site: MW-132R, MW-133R, MW-145, MW-147AR, and MW-302
  - Off-Site: MW-160, MW-167S, MW-169S, and MW-169 D
- Discontinued monitoring of the following ESA wells:
  - On-Site: MW-135, MW-200
  - Off-Site: MW-301,
- Discontinued monitoring of the following EBSA wells:
  - IW-1 and IW-2
- Discontinued analysis for PAH and metals
- Reduction in monitoring frequency from quarterly to semi-annually

3 Remediation Overview

Remedial measures implemented to date at the Site include:

- excavation and disposal of buried debris and contaminated soil from the WSA
- installation and operation of VOC groundwater remediation systems in the WSA and ESA
- phytoremediation along the entire southern Site property boundary to mitigate groundwater plume migration
- bioremediation in the EBSA
- quarterly groundwater monitoring beginning in 2003 to evaluate remedial progress and plume stability.

A summary of each remedial measure is provided below.

WSA

April-July 2001 Removal Action

Several areas of buried debris were defined in the western portion of the Site using geophysical techniques. Between April and July of 2001, approximately 10,000 tons of buried debris and contaminated soil was excavated over an approximately 0.5-acre area and properly disposed at a permitted hazardous waste landfill. Confirmation soil sampling conducted during the removal action verified that all source material in the burial areas was removed and soil remedial objectives were achieved.

During the removal action, it was observed that some buried debris extended beneath the western portion of the Site building. Soil borings advanced inside the building indicated the debris layer extended approximately 100 feet to the east and approximately 75 feet north from the southwest corner of the building. The average thickness of the debris was approximately three feet. Based on these dimensions, it was estimated that approximately 1,100 tons of debris remains beneath the building. Removal of the debris is not feasible without demolition of the building. As stated in the IDEM approved RWP, ICs will be implemented as an exposure prevention remedy for this area of the building.

August –October 2006 Removal Action

Concurrent with the initial removal action, an area of TCE and lead soil impacts referred to as the “Hot Spot” was discovered along the western property boundary near Holt Road during a Site-wide soil investigation. The “Hot Spot” area was addressed through expansion of the AS/SVE system as discussed below. TCE and cDCE concentrations in groundwater down-gradient of this area continued to fluctuate above and below their respective NRCGs after implementation of the AS/SVE. Therefore, a subsequent soil removal action was conducted in the “Hot Spot” area. Between August and October 2006, a total of approximately 8,500 tons of additional impacted soil was removed and properly disposed at a permitted hazardous waste landfill. Confirmation soil samples indicated one small area of VOC soil impacts above the

remedial objectives remained at the Holt Road entrance. Because of the close proximity to Holt Road, no further excavation was performed.

Phytoremediation and Air Sparge/Soil Vapor Extraction (AS/SVE) Systems

Prior to the installation of the systems, phytoremediation was implemented along the entire southern property boundary of the Site to mitigate groundwater plume migration. AS/SVE Systems were installed to remediate VOCs in groundwater in the WSA and ESA. Two systems (Northwest and Southwest) were installed in the WSA and one system (East) was installed in the ESA. The systems began operation in July 2001. The Northwest System was operated until December 2003. The East SVE/AS remediation System was shut down in January 2006 subsequent to achieving groundwater remedial objectives. Subsequent soil confirmation sample data collected from the East SVE/AS area also indicated the soil media had achieved remedial objectives. The Southwest system continued to operate because of fluctuating VOC levels in MW-148AR and MW-153. With the approval of IDEM, this system was subsequently shut down in June of 2010. A complete summary of the selection, design, and installation of the AS/SVE systems was documented in Section 8.2 of the Final RWP.

The Final RWP also identified a plan to expand the WSA AS/SVE System to remediate the previously discussed “Hot Spot” area. The expansion included the installation of four additional nested SVE wells, associated subsurface piping, and their connection to the AS/SVE System during the period of August 25 through September 18, 2003. The expansion was documented in Section 8.3 of the Final RWP. The AS/SVE system expansion was operated until 2006, at which time the decision was made to conduct the previously described 2006 removal action.

East Off-Site (Bio-Remediation) Area

A small anomalous area of TCE occurrence in groundwater was noted in the area of MW-163 located to the east of the Site across Olin Avenue. As a protective measure, this area underwent remediation by reductive dechlorination. Remedial objectives for this area were developed for the vapor intrusion pathway. Cleanup goals calculated for this pathway were 1,800 µg/L for TCE, 104,000 µg/L for cDCE, and 198 µg/L for VC. Remediation consisted of reductive dechlorination through addition of a biodegradable carbon source to stimulate biological activity. Corn syrup was used as the carbon source. The Corn syrup injection system was installed in March 2004. Monitoring well MW-173 was installed at this time to monitor bioremediation progress. Full-scale corn syrup injections were conducted in July 2004; October 2004; and October 2006. Current COC concentrations in IW-1, IW-2, MW-163, and MW-173 are below Site-specific remedial objectives.

4 Field Methods

4.1 Monitoring Well Nest Installation

ENVIRON installed four permanent monitoring wells in two nests (MW-174, MW-175) located on the east side of Holt Road adjacent to the Michigan Meadows Apartments on July 12-13, 2011 in accordance with ENVIRON's standard operating procedures (SOP) in Appendix A. Both monitoring well nests included a shallow well with a 10-ft screen interval (MW-174: 15-25 ft below ground surface (bgs); MW-175: 14-24 ft bgs) that straddles the water table surface and a deep well with a 5-ft screen interval at the base of the sand unit (MW-174: 48 ft bgs; MW-175: 42 ft bgs). The wells were installed by ENVIRON's contractor, WDC Exploration & Wells of Indianapolis, Indiana, using a MiniSonic drill rig. A continuous soil core was extracted from each well nest location using 5-foot long by 3-inch diameter stainless steel rods advanced by using sonic drilling methods. A ten-inch diameter outer casing was then sonically advanced over the core barrel. The core barrel was then returned to the surface and the soil was extracted in five-foot long continuous cores. Both the core barrel and outer casing were decontaminated with a non-phosphate detergent and rinsed with tap water. Soil samples were continuously logged for soil texture and screened for the presence of VOC's using a photoionization detector (PID). Soil samples for laboratory analysis were collected from near surface (2-4 ft bgs) and from just above the water table (MW-174: 10-12 ft bgs; MW-175: 13-15 ft bgs) using a TerraCore sampler. The samples were placed in an ice-packed cooler and transported to Pace Analytical Services, Inc. (Pace) using proper quality assurance/quality control (QA/QC) procedures and chain-of-custody protocols.

The shallow and deep monitoring wells at each nest were installed in the same borehole. Each monitoring well was constructed using 2-inch diameter, polyvinyl chloride (PVC) well screens with PVC risers. A filter pack consisting of No. 5 coarse-grained sand was placed around each well screen to approximately 2 feet above the top of the screen. A seal consisting of bentonite chips was placed above the filter pack to 1-foot below the ground surface. The wells were completed at the ground surface with a flush-mounted steel protective cover in concrete. Each well was developed upon completion. Well construction details for all wells are available in Appendix B. The elevation and location of each monitoring well was surveyed by ARE Surveying Consultants, Inc., a licensed professional surveyor. Soil cuttings and purge water generated during the well installation was containerized and staged on site for disposal pending receipt of laboratory analysis. All generated wastes will be disposed of in a properly permitted facility in accordance with appropriate Federal, State, and local regulations.

4.2 New Monitoring Well Nest Groundwater Sampling Methods

The four new monitoring wells (MW-174S, MW-174D, MW-175S, and MW-175D) were sampled on July 18, 2011 five days after their installation, and were again sampled on September 13, 2011 during the semi-annual groundwater sampling event. The monitoring well nests are not planned to be sampled as a part of the ongoing groundwater monitoring program. The monitoring wells were sampled using a bladder pump and low-flow purge techniques in accordance with ENVIRON SOPs in Attachment A. Prior to sampling, the newly installed well nests and existing monitoring well network were gauged with an electronic water level indicator to collect water level data for determination of Site-specific groundwater flow. After stabilization

of water quality parameters, groundwater samples were collected from the monitoring wells and placed in an ice-packed cooler. Groundwater samples were submitted under proper chain of custody to Pace Analytical Laboratories for analysis of VOC by EPA Method 8260B. Groundwater sample information sheets are provided in Appendix C.

4.3 Semi-annual Groundwater Sampling Methods

Routine groundwater sampling was conducted during the first and third quarters of 2011 using low-flow purge techniques in accordance with ENVIRON SOPs. Twenty-seven monitoring wells were sampled in accordance with Section 8.4 of the RWP during the first quarter event on February 14-18, 2011. Twenty-three monitoring wells were sampled during the third quarter event on September 12-16, 2011 including the recently installed monitoring well nests MW-174 and MW-175 (4 wells total) described in Section 4.2 and nineteen wells identified in the approved modified groundwater monitoring program. Monitoring well MW-157 could not be located during either sampling event. Monitoring well MW-159 could not be sampled during the first quarter event because of standing water at the well location.

The monitoring wells were sampled using a bladder pump and low-flow purge techniques in accordance with ENVIRON SOPs. Prior to sampling, the newly installed well nests and existing monitoring well network were gauged with an electronic water level indicator to collect water level data for determination of Site-specific groundwater flow. After stabilization of water quality parameters, groundwater samples were collected from the monitoring wells and placed in an ice-packed cooler. Groundwater samples were submitted under proper chain of custody to Pace Analytical Laboratories for analysis of VOC by EPA Method 8260B at all locations and for total organic carbon by EPA Method 415.1at IW-1 during the February sampling event. The Data Quality Level for all analysis was Level IV. Groundwater sample information sheets are provided in Appendix C.

5 Soil Analytical Results

Soil samples collected from MW-174 and MW-175 on July 12, 2011 did not contain any detectable VOC concentrations. All reporting levels for the soil analytical results were below the Tier II RCGs. The laboratory analytical report is provided in Attachment D.

6 Groundwater Monitoring Results

Analytical results from the first and third quarter 2011 groundwater sampling events are discussed in the following sections.

6.1 Liquid Level Measurements

Liquid level data from the February, July, and September 2011 groundwater monitoring events along with historical liquid level data are summarized in Table 1. Groundwater elevations ranged from 694.48 to 700.10 feet above mean sea level (amsl) in February, 695.57 to 701.07 feet amsl in July, and 694.23 to 699.84 feet amsl in September. The groundwater potentiometric surface determined from the shallow and deep monitoring well data are depicted on Figures 2 through 7 and illustrate a southerly flow direction consistent with historical observations.

The U.S. Environmental Protection Agency (EPA) was given access to collect water level measurements from Site monitoring wells on December 6, 2011 as part of EPA's groundwater investigation of the West Vermont Street residential area. These water level data are also included in Table 1 and the shallow and deep groundwater potentiometric surface determined from these data are depicted on Figures 8 and 9, respectively. The figures also include groundwater elevation data from monitoring wells at the dry cleaner site to the south. These data also indicate a southerly flow direction consistent with historical observations.

6.2 Laboratory Analytical Results

6.2.1 VOC

VOC analytical results from the shallow and deep monitoring wells are summarized in Tables 2a and 2b, respectively, and are depicted in Figures 10 through 13. Laboratory analytical reports are provided in Appendix D. TCE, cDCE, and VC are the primary groundwater COC present at concentrations above remedial objectives. The data are consistent with sampling events of the last two years, with stable or decreasing concentrations in the majority of the wells. Monitoring well IW-2 in the EBSA exhibited a marked increase of PCE concentrations from 55 µg/L in December 2010 to 430 µg/L in February 2011. VOCs were not detected in groundwater samples collected from the newly installed monitoring well nests MW-174 and MW-175 in July. In September, cDCE was detected at a concentration less than the RCG in the groundwater sample collected from MW-174D. No other VOCs were detected in September.

6.2.2 East Off-Site Area Bioremediation Parameters

Recent and historical field water quality data are summarized in Table 3. As part of the post-remedial monitoring, ENVIRON has routinely sampled injection well IW-1 for TOC during the quarterly monitoring events. The recent and historical TOC data is also included in Table 3.

The TOC concentration in IW-1 was 1.8 milligrams per liter (mg/L) in February. This concentration, when compared against previous post-treatment concentrations, indicates that the influence of the enhanced reductive dechlorination injections has waned and the subsurface is returning to ambient conditions. TOC analysis was not conducted in September in accordance with the IDEM approved modified groundwater monitoring program.

7 Remedial Progress Status

The status of remedial progress for each source area is discussed in the following sections.

7.1 WSA

Except for one confirmation soil sample collected at the Holt Road entrance, soil remedial objectives have been achieved. This single location is considered *de minimis* and no further soil remediation is planned. In groundwater, COCs are currently below NRCGs in all on-Site monitoring wells with the exception of VC in source area well MW-148R. VC levels in MW-148R have fluctuated above and below its NRCG of 10 µg/L for the past two years. As noted in the Remedial Progress Report dated March 2011, VC concentration trends in MW-148AR were stable for the 28 quarters ending in December 2010. The VC results from the February 2011 and September 2011 indicate the stable trend is continuing.

cDCE and VC groundwater concentrations continue to remain above the RCGs off-Site to the south. TCE and VC continue to fluctuate above and below NRCGs in MW-161 located just north of Little Eagle Creek. VOC result from the February 2011 and September 2011 indicate that VOC levels in shallow and deep wells are continuing to decline or remain stable, as identified in the ENVIRON Remedial Progress Report, March 2011.

7.2 Eastern Source Area

Confirmation soil sample results indicate soil remedial objectives have been achieved. In groundwater, all of the COCs in all on-Site monitoring wells are currently below NRCGs, with the exception of TCE in the source area well MW-10-1R. TCE in MW-10-1R has fluctuated above and below its NRCG of 260 µg/L for the past two years. The TCE trend in MW-10-1R was stable for the 28 quarters ending December 2010 but has increased from 59 µg/L to 534 µg/L since the remediation system was turned off in this area in January 2006 (ENVIRON Remedial Progress Report, March 2011).

TCE groundwater concentrations continue to remain above the RCGs off-Site to the east-southeast, however, as noted in the ENVRION Remedial Progress Report, March 2011, the TCE concentrations are generally stable. TCE results from the February 2011 and September 2011 event indicate that the stable trend is continuing. VC has been historically detected above its RCG of 2 µg/L in MW-156 and continues to fluctuate above and below its detection limit. It was not detected in February, but was detected at 5.3 µg/L in September. VC is not detected in any other off-Site monitoring well.

7.3 East Off-Site Area

Key locations used to evaluate bioremediation progress in the East Off-Site Source area include monitoring wells MW-163 and MW-173 and injection wells IW-1 and IW-2. VOC concentrations have remained stable over the past two years, however, IW-2 exhibited a marked increase of PCE concentrations from 55 µg/L in December 2010 to 430 µg/L in February 2011. The detected VOC concentrations remain below the calculated residential cleanup goals based on the vapor intrusion pathway. Field parameters generally indicate that the aquifer has returned to ambient conditions.

8 Conclusions

Based on the findings of the recent well installation and groundwater sampling events, the following is concluded:

On-Site Remedial Progress

On-site remedial objectives have been essentially achieved. Concentrations of VC in the WSA and TCE in the ESA occasionally fluctuate above and below their respective NRCGs. Some rebound of TCE groundwater concentrations has been observed in the ESA since the remediation system was turned off in 2006 and continued monitoring in the ESA will be performed to evaluate whether additional remedial efforts are needed. The Southwest AS/SVE Remediation System was turned off in June of 2010. No rebound of groundwater concentrations has been observed in this area and continued monitoring will be performed. Monitoring well IW-2 in the EBSA will be sampled during the next sampling event to verify the increased PCE concentration detected in February 2011 and further evaluate remedial progress in this area.

Off-Site Remedial Progress

The off-site groundwater plumes from both the WSA and ESA are stable and, in response, the IDEM approved a reduced groundwater monitoring program in May 2011. VOCs were not detected in excess of RCGs in groundwater samples collected from new monitoring well nests installed along Holt Road west of the Michigan Meadows Apartments. This confirms the western edge of the groundwater plume is delineated and no further investigation is needed. Groundwater monitoring will continue in accordance with the IDEM approved modified groundwater monitoring program.

[1]For wells surveyed more than once, subsequent survey information is listed with the first gauging event following the survey.
[2]Survey data from 3-6-02 were used to calculate all groundwater and screen elevations.
[3]Survey data from 11-7-00 were used to calculate the groundwater elevation.
[4]Wells redeveloped, extended and resurveyed. New survey data from 1-27-10 now being used to calculate groundwater elevations.
[5]Well resurveyed by EPA in fall of 2010 during EPA's West Vermont Street study.
amsl - above mean sea level
BGS - below ground surface
DTW - depth to water
GW - groundwater
NA Information is not available
SW - surface water
TOC - top of well casing

Detected compound exceeds the VRP Tier II Non-Residential Cleanup Goal
Detected compound exceeds the VRP Tier II Residential Cleanup Goal
Detected compound is below the VRP Tier II Residential Cleanup Goal

VOCs = Volatile Organic Compounds
Samples analyzed using EPA SW-846 Method 8260
µg/L = micrograms per liter
E = Result is Est NA = Not Applicable NS = Not Sampled

*cis-1,2-Dichloroethylene and trans-1,2-Dichloroethene results are combined

[1] Indiana Department of Environmental Management Voluntary Remediation Program Resource Guide, Appendix F Tier II Cleanup Goals-Human Health Evaluation by Office of Environmental Health Evaluation by Office of Environmental Response, July 1996.

[2] Calculated using surrogate toxicity values and Tier II equations.
[3] Exceeded analytical holding time for vinyl chloride.
[4] Exceeded analytical holding time.
[5] Exceeded analytical holding time for cis-1,2-Dichloroethene.

Detected compound exceeds the VRP Tier II Non-Residential Cleanup Goal

Detected compound exceeds the VRP Tier II Residential Cleanup Goal

Detected compound is below the VRP Tier II Residential Cleanup Goal

VOCs = Volatile Organic Compounds

Samples analyzed using EPA SW-846 Method 8260

µg/L = micrograms per liter NS = Not Sampled

[1] Indiana Department of Environmental Management Voluntary Remediation Program Resource Guide, Appendix F Tier II Cleanup Goals-Human Health Evaluation by Office of Environmental Response, July 1996.

[2] Calculated using surrogate toxicity values and Tier II equations.

[3] Exceeded analytical holding times for cis-1,2-Dichloroethene and vinyl chloride.

[4] Exceeded analytical holding time for vinyl chloride.

Appendix A

Standard Operating Procedures

Standard Operating Procedure: Monitoring Well Installation and Development

This standard operating procedure (SOP) is applicable to the installation and development of wells for groundwater monitoring or remediation purposes. This SOP is generic in nature and may be modified in whole or part depending on constraints presented by site conditions and equipment limitations. Modifications of methodologies will be documented in the appropriate field logbook and discussed in reports summarizing field activities. The procedures herein are consistent with Indiana state statutes and rules 312 IAC 12, 312 IAC 13, IC 25-17.6, IC 25-39, and 329 IAC 9.

Well Installation

Prior to invasive activities, a subsurface utility check will be conducted. Wells will generally be constructed using 5- to 10-foot-long screen and sufficient riser to complete the well to, or slightly above, ground surface. The length of the well screen will be selected based on the planned use of each well and the observed lithology. Wells will be constructed using schedule 40 polyvinyl chloride (PVC) casing and 0.010 slot schedule 40 PVC well screen with a threaded bottom cap. Wells will generally be completed with a protective steel cover equipped with a lock to protect the well against damage and unauthorized entry.

Filter Material

Filter material will be well-graded, clean sand (generally less than 2-percent by weight passing a No. 200 sieve and less than 5 percent by weight of calcareous material).

Setting Wells

Upon completion of borehole drilling, the boring will be sounded to determine the total depth, and the PVC well materials will be assembled and lowered into the boring. PVC well materials will be measured to the nearest 0.1 foot and will be assembled such that the screened interval is positioned opposite the target formation. No PVC cement or other solvents will be used. Once the well has been positioned at the desired depth, filter sand will be slowly added to the borehole to fill the annular space to a depth approximately 1 to 2 feet above the top of the well screen. During sand placement, the driller will continually measure the depth to the sand using a weighted tape measure or other device to verify that the sand does not bridge between the auger and the well screen. Two feet of bentonite chips will be added on top of the filter sand and subsequently hydrated using clean, municipal water to form a transition seal. After the bentonite has hydrated for at least 30 minutes, the depth to the top of the bentonite will be measured and recorded. A neat cement/bentonite grout will be added from the top of the bentonite; a tremie pipe will be utilized to ensure that the grout is added from the bottom, upwards.

Well Completion

All monitoring wells and monitoring points will be completed with a protective steel cover equipped with a lock to protect the well against damage and unauthorized entry. Wells will typically be completed above grade unless they are located within parking/driving areas, or are piped to a remediation system. Wells completed aboveground will be capped with a push-on

well cap and completed with a steel stick-up casing. Wells completed bgs will be capped with an expandable locking well cap and completed with a flush mounted traffic rated steel cover set into a 2 foot by 2 foot concrete pad. All wells will be labeled with a permanent marker that includes the well ID.

Development and Surveying

New wells will be developed after the grout has cured for a minimum of 48 hours. Wells will be developed by surging, bailing, and pumping to reduce or remove drilling-induced formation smear from the borehole walls, to remove sediment that may have accumulated during well installation, consolidate the filter pack, and to enhance the hydraulic connection between the formation target zone and the well. In most cases, a bailer or pump will be used to remove sediment and turbid water from the bottom of the well. A surge block will then be lowered up and down within the screened interval to flush the filter pack of fine sediment and remove smear from borehole walls. Following surging, the well will be bailed or pumped again to remove sediment and turbid water. Water will be removed from the well at a rate greater than the anticipated future pumping rate and water quality parameters including pH, turbidity, specific conductance and temperature will be recorded. Drawdown will also be recorded with an interface probe or water level meter. The development will proceed until sediment is removed sufficiently to achieve a turbidity measurement of 5 NTU (or less). The well installation report will specify if the target turbidity cannot be achieved.

Following well installation and completion, each well will be surveyed by a licensed surveyor to determine the location of the well and to establish the elevation at the top of casing and ground surface with reference to the site datum. Survey data will be incorporated into the database and onto the site base map.

Decontamination of Drilling Equipment

All drilling and well development equipment will be cleaned prior to use, and between wells. Drilling equipment will be steam cleaned, rinsed with potable water, and air dried. If equipment is not immediately put back to use, equipment will be covered with clean plastic to protect the materials from contact with dust or other contaminants. Pumps or other non-dedicated field equipment that comes into contact with impacted media will be cleaned using a non-phosphate detergent followed by a tap water rinse and a final, deionized water rinse. Decontamination water will be collected for appropriate, subsequent off-site disposal. Spent PPE or other disposable materials (e.g., tubing) will be placed into a drum for subsequent disposal.

Documentation

Well installation and construction activities will be recorded in the field notebook. A well construction diagram will be completed for each well, reviewed by appropriate personnel for completeness and accuracy, and filed electronically in the project file.

Standard Operating Procedure: Groundwater Sampling and Field Measurement Procedures

This standard operating procedure (SOP) sets forth the field procedures for the sampling of groundwater. The procedures include monitoring well inspection, groundwater elevation measurement, decontamination of nondedicated sampling equipment, and groundwater sampling.

Monitoring Well Inspection

The condition of the monitoring wells will be inspected and documented as necessary during each sampling event prior to the collection of data. The following information may be noted:

- Protective casing – Inspect for the presence of a lockable protective cover, and determine if the physical condition of the casing is adequate and allows for sampling. Inspect for a drain hole near the base of the casing. If clogged or not present, attempt to clean out the hole or drill a new one. If damage to the protective casing exists such that sample collection cannot be completed, field staff will notify the Project Manager to determine a course of action. If it is determined that the cover needs replacement, sampling of the well may require postponement or cancellation, depending on the significance of the location of the well in question. Notes regarding the conditions will be entered in the field notebook.
- Surface seal – In general, the surface seal underlies a sloping concrete pad that has been installed around the base of the protective casing with a lockable cover. Inspect the concrete pad for cracking or other conditions that may potentially allow surface water to enter the annular space between the protective casing and the well riser. Note observations in the field notebook so that appropriate future corrective action can be taken.
- Degree of immobility of protective casing – Place hands on the protective casing and gently but firmly attempt to move the casing. If the casing moves easily, it will require future re-setting, and appropriate notes will be entered in the field notebook. This condition will not preclude sampling.
- Permanent legible labels – Each well should have a permanent label indicating the well name/number. If a label is missing or not legible, use a permanent marking device to re-label the well appropriately after confirming the identity of the well through the use of site maps, depth-to-bottom measurements, or other methods.
- Lock – Each well should be locked with a similarly keyed lock. If an individual lock is damaged to the point that it is not functional, or if a lock from an unknown origin is in use, it will be removed with a bolt cutter and replaced. Missing locks will also be replaced. Field notes will include documentation of lock replacement if it is required. The key numbers for replaced locks will be entered in the field notebook.
- Well cap – **Note**: **Prior to opening the well cap, inspect for the presence of biting or stinging inspects and/or poisonous plants.** After opening each well, a PVC slip-on cap should be found in-place over each well riser. Missing caps will be replaced with one of

similar size and type. An air venting hole will be drilled into each replacement well riser cap. The field notebook will include documentation of well cap replacement if it is required.

- Well plumbness check (ease of inserting/removing bailer) – Low-flow pumping techniques will be used to sample wells. As such, well plumbness should not be an issue. However, if a well is suspected of being significantly out of plumb, a 3-foot-long bailer will be inserted to the bottom of the well to determine well condition. Problem wells will be noted in the field notebook and may be repaired in the future after evaluation of the problem.
- Sediment in well – The potential presence of sediment in each well will be checked based on a comparison of historical depth-to-bottom measurements with current measurements obtained after completing the groundwater level measurements. A water level tape will be lowered to the bottom of each well, and a depth measurement will be recorded in the field notebook. The measurement will then be compared to historical well depth measurements and the original well construction log to determine the depth of sediment that may be present in the well. Significant volumes of sediment, as indicated by sediment depths near or greater than the screen length, can impede groundwater sampling and may require re-development of an individual well.

  If required, redevelopment of a well will be performed using a bailer to surge and purge the individual well of sediment-laden water. Pumping may also be employed to remove sediment. The volume of water removed will be recorded in the field notebook. After redevelopment has proceeded for a reasonable time, the procedure will be stopped to allow suspended solids to settle in the well. Measurement of the depth-to-bottom will then be repeated to determine the volume of solids removed. Redevelopment will proceed until the field sampler determines that a representative sample can be collected. If redevelopment is unsuccessful, the Project Manager will be notified to determine a course of action.

Groundwater Elevation Measurement

In order to determine the static water elevation, the static water level will be measured prior to purging and sampling at each monitoring well in the sampling program. All static water level measurements will be obtained on the first day of the sampling event or within a 24-hour period, except as described in the following section. The measurements will be obtained prior to purging the monitoring wells for water quality sampling. The vertical reference points (e.g.,. top-of-casing and ground surface) have been surveyed to the nearest 0.01 foot and referenced to the local coordinate system.

Depth to water will be measured using an electronic water level meter such as a Solinst Model 101 water level meter or equivalent. Prior to use, the downhole cable must be cleaned and the unit turned on. The probe is lowered into the well until a beep tone is heard. At this depth, the marking on the cable is read in feet to the nearest hundredth at the reference point. No calibration is needed. Groundwater elevation will be calculated as the surveyed reference point elevation (in feet) minus the depth to water.

Decontamination Procedures for Non-Dedicated Sampling Equipment

Proper decontamination of sampling equipment is essential to minimize the possibility of cross-contamination of samples. Non-dedicated equipment used for sampling various environmental media (soil, groundwater, surface water, etc.) will be cleaned before its initial use in the field and again before use at each subsequent sampling site.

All non-dedicated sampling equipment will be new, or will be decontaminated prior to its initial use on-site. Decontamination procedures will include the following steps:

1. Wash the equipment in a non-phosphate detergent.

2. Rinse with potable tap water.

3. Rinse with deionized (DI) or distilled water.

Non-dedicated equipment that is to be used at additional locations at the site will be field-decontaminated between sampling locations. The field decontamination of sampling equipment will take place at the sampling location. All decontamination water will be contained in 5-gallon plastic buckets and combined with other decontamination wastewater.

To the extent practicable, single-use sampling equipment and materials will be used for the collection of all environmental samples. The materials used will be new and clean, and will be placed in plastic for transport to the site. Once used, this equipment will be placed in plastic bags and managed as investigation-derived waste material.

Groundwater Sampling Procedures

Groundwater samples will be collected from the selected monitoring wells using a low-flow pumping technique. This sampling method involves purging the well with the pump intake set at the desired sampling depth at a rate that should not mobilize naturally non-mobile colloidal matter, does not create excessive water level drawdown, minimizes pressure changes in the purged water, and does not appreciably change the oxidation-reduction state of the sample. This sampling method minimizes the disturbance of the sample, thereby reducing sampling artifacts, and improves the consistency and quality of the groundwater sample results. In addition, the low-flow sampling method significantly reduces the volume of potentially contaminated purge water generated during the sampling process. In general, low-flow purging and sampling methods developed by USEPA (See for example USEPA, 1996a) will be followed.

Each monitoring well will be pumped using a submersible pump (e.g.,. Bladder, Keck™, Grundfos™, Whale™, or equivalent pump). The submersible pump intake (or tubing) will be slowly lowered to the middle of the screened interval and the well will be pumped at a flow rate ranging from 100 to 500 milliliter/minute (mL/min). The pumping rate for each monitoring well is dependent on the hydraulic properties of the formation the well is screened across, and will be determined in the field to be the highest flow rate attainable without creating drawdown greater than approximately 0.1 meter (0.3 feet), or at a minimum of 100 mL/min. During pump start-up,

drawdown may exceed the 0.1 meter target and then recover as pump flow adjustments are made. Drawdown monitoring should utilize the stabilized drawdown level, not the initial level.

A flow-through cell equipped with temperature, oxidation-reduction potential, dissolved oxygen, specific electrical conductance, pH, and turbidity probes will be connected to the discharge tubing from the pump. Each of these parameters will be measured at each well during purging to evaluate stabilization. Wells will be considered stable when the following conditions apply between three successive 3 to 5 minute sampling intervals:

- The temperature change is within 0.5°C.
- The conductance change is within 3%.
- The turbidity change is within 10% or the reading is below 10 nephelometric turbidity units (NTUs).
- The dissolved oxygen change is within 10%.
- The redox (E_H) change is within 10 mV.
- The pH change is within 0.1 pH units.
- The water level drawdown is less than 0.1 meters during purging.

The wells will be sampled immediately following stabilization. The samples will be taken from the pump discharge after the flow-through cell has been disconnected.

In accordance with USEPA's "Low Stress (low flow) Purging and Sampling Procedure for the Collection of Ground Water Samples from Monitoring Wells" (USEPA, 1996b), if the aquifer transmissivity is too low to yield sufficient water to limit drawdown on the submersible pumps lowest flow setting, causing the well to be dewatered during purging, the well will be sampled as soon as the water level has recovered sufficiently to collect the appropriate sample volume needed for analysis. Recovery will be determined by monitoring the water level within the well. During the recovery period the pump intake will not be moved and samples will be collected even though the indicator field parameters may not have stabilized.

Groundwater pumped during purging, tubing, and other general waste materials generated by the sampling will be collected and managed as investigation-derived waste materials.

Calibration Procedures – The pH, ORP, specific conductance, turbidity, and dissolved oxygen meters will be calibrated daily in accordance with manufacturer's instructions. Calibration information will be recorded in the field logbook.

Operation Procedures – The sampling pump, flow-through cell, and meters will be operated according to the manufacturer's instructions.

Maintenance Procedures – The sampling pump, flow-through cell, and meters will be maintained according to the manufacturer's instructions. Maintenance information will be

recorded in the field logbook. Replacement sampling pumps, flow-through cells, and meters will be available on site or ready for overnight shipment, as necessary.

Sample Handling and Chain of Custody

All samples will be stored on ice immediately after collection. Field personnel will be aware of the holding times for specific parameters and will make arrangements to have the samples delivered to the laboratory to meet these holding times. Samples will remain in the custody of the field sampling team until shipped.

Chain-of-custody documentation enables possession of a sample to be traced from sample collection through analysis and disposal. A chain-of-custody protocol will be established to document control of the samples from the point of collection to delivery to the analytical laboratory. Samples will be under the custody of a designated person at all times. The control of custody will be documented on a chain-of-custody form. The chain-of-custody form will document the names, signatures, and affiliations of personnel in custody of the samples, and the dates and times custody was transferred. The sampling personnel will be responsible for sample custody in the field. The laboratory sample custodian and analysts will be responsible for custody of the sample at the laboratory.

A copy of the chain-of-custody form will be placed in the project files, and the original will accompany the samples to the laboratory. The identity of field duplicate samples will not be disclosed to the analytical laboratory.

Shipping containers will be sealed and will be accompanied by the chain-of-custody form, with appropriate signatures. The transfer of custody is the responsibility of the sampling personnel and the laboratory staff. The procedures to be implemented are as follows:

- Place completed chain-of-custody forms in a plastic bag, seal the bag, and tape it to the inside cover of the shipping container.
- After the samples are iced, seal the coolers with strapping tape and custody seals (if applicable), add the date to the custody seals, and ship the coolers to the laboratory using overnight delivery, using a courier service, or by delivering them directly to the laboratory.
- Identify common carriers or intermediate individuals on the chain-of-custody form, and retain copies of all bills-of-lading.
- When the samples are received in the laboratory, handle and process them in accordance with the procedures in the laboratory's SOPs, or specified analytical methods.

In the laboratory, a sample custodian will be assigned to receive the samples. Upon receipt of the samples, the custodian will inspect the condition of the samples, reconcile the samples received against the chain-of-custody form, check the temperature of the samples, log the samples in the laboratory log book, and store the samples in a secured sample storage room or cabinet maintained at an appropriate temperature until assigned to an analyst for analysis. Custody will be maintained until the samples are discarded.

When samples requiring preservation by either acid (except samples for VOC analysis) or base are received at the laboratory, the pH will be measured and documented. The laboratory sample custodian will adjust the pH, if necessary, and will notify the laboratory QA/QC Coordinator of the pH adjustment so that sample collection procedures can be reviewed to determine if a modification is necessary.

Discrepancies observed between the samples received, the information on the chain-of-custody form, and the sample analysis request sheet will be resolved before the sample is assigned for analysis. The laboratory QA/QC Coordinator will be informed of any such discrepancy, as well as its resolution. Results of the inspection will be documented in the laboratory sample logbook. Discrepancies will be documented in the analytical case narrative, as appropriate.

14:30	12.31'	3.0	200	6.46	1.46	0.0	10.71	1.11	-99
14:35	12.31'	4.0	200	6.46	1.45	0.0	10.77	0.89	-105
14:40	12.31'	5.0	200	6.47	1.45	0.0	10.82	0.79	-110
14:45	12.31'	6.0	200	6.48	1.44	0.0	10.87	0.55	-115
14:50	12.31'	7.0	200	6.49	1.44	0.0	10.86	0.54	-117
14:55	12.31'	8.0	200	6.49	1.43	0.0	10.88	0.54	-120

Sample Parameter	Sample Volume	Bottle Type	Number of Bottles	Preservation/Prep
VOC	120mL	VIAL	3	HCL
TOC	250 mL	Amber	1	H2SO4

Comments/Observations/Weather Conditions: Clear, mid 30's. Ice melting some causing puddles
Purge start: 14:15
Purge stop: 15:00

Horiba U52: U57890X MP10: 2417
Water level: 59184 compressor: 21927

Low Flow Sampling: Well purge flow rate of approximately 0.5L/min or less. Collect in-line water quality measurements and depth to water measurements every 3 to 5 minutes. If excessive drawdown (>0.5 ft.), reduce purge rate (0.2 L/min). Stabilization with three successive readings of ± 0.1 pH, ±3% conductivity, ±10% temperature, turbidity, and DO. Disconnect in-line water quality meter prior to sampling.

Comments/Observations/Weather Conditions: Purge Start: 14:32 Stability Reached: 15:06
IW-2 Sampled: 1510

Low Flow Sampling: Well purge flow rate of approximately 0.5L/min or less. Collect in-line water quality measurements and depth to water measurements every 3 to 5 minutes. If excessive drawdown (>0.5 ft.), reduce purge rate (0.2 L/min). Stabilization with three successive readings of ± 0.1 pH, ±3% conductivity, ±10% temperature, turbidity, and DO. Disconnect in-line water quality meter prior to sampling.

Comments/Observations/Weather Conditions: Clear 27°F ice on ground collecting Dup.
MW-150 is West of MW-200
Purge start: 09:55
Purge stop: 10:50
Horiba U52-US7890X MP10-2417
water level- US1540X compressor- 21927

Low Flow Sampling: Well purge flow rate of approximately 0.5L/min or less. Collect in-line water quality measurements and depth to water measurements every 3 to 5 minutes. If excessive drawdown (>0.5 ft.), reduce purge rate (0.2 L/min). Stabilization with three successive readings of ± 0.1 pH, ±3% conductivity, ±10% temperature, turbidity, and DO. Disconnect in-line water quality meter prior to sampling.

Sample Parameter	Sample Volume	Bottle Type	Number of Bottles	Preservation/Prep
VOC	120 mL	40 mL Amber	3	HCl

Comments/Observations/Weather Conditions: Started Purge: 11:15 Stability Reached: 11:57
Sampled: 12:00

Low Flow Sampling: Well purge flow rate of approximately 0.5L/min or less. Collect in-line water quality measurements and depth to water measurements every 3 to 5 minutes. If excessive drawdown (>0.5 ft.), reduce purge rate (0.2 L/min). Stabilization with three successive readings of ± 0.1 pH, ±3% conductivity, ±10% temperature, turbidity, and DO. Disconnect in-line water quality meter prior to sampling.

Well material: (PVC) / #316 SS / Galv. Steel
Other:

1) Well depth (from top of measuring point) (1) 19.5 (ft)
2) Depth to water prior to purging (2) 12.94 (ft)
3) Length of water column in well: #1 - #2 = (3) - (ft)
4) Volume of water standing in well (4) - (gal)
multiply #3 by 0.1632 for 2" ID and 0.0408 for 1" ID wells.
(Required for well volume purging approach only)
5) Number of purge volumes required (5) -
6) Maximum volume to be purged: #4 x #5 = (6) - (gal)

Bladder Pump Controller Settings (if used): Recharge time: 10 (sec) Pressure: 12 (psi)
Discharge time: 5 (sec) Cycles per minute: 4

Stabilization:

Time	Depth to Water (ft)	Volume Pumped (_____)	Pumping Rate (ml/min)	pH	Conductance mS/cm	Turbidity (NTU)	Temp (°C)	DO (mg/L)	ORP (mV)
820	13.02		200	-	-	-	-	-	-
840	13.02		200	6.53	2.88	0.0	15.80	1.10	239

855	13.02		200	6.81	2.85	0.0	15.38	0.00	190
900	13.02		200	6.82	2.84	0.0	15.36	0.00	187

Sample Parameter	Sample Volume	Bottle Type	Number of Bottles	Preservation/Prep
VOC	40 ml	Amber VOA	3	HCl

Comments/Observations/Weather Conditions: Overcast, ~61°F

Low Flow Sampling: Well purge flow rate of approximately 0.5L/min or less. Collect in-line water quality measurements and depth to water measurements every 3 to 5 minutes. If excessive drawdown (>0.5 ft.), reduce purge rate (0.2 L/min). Stabilization with three successive readings of ± 0.1 pH, ±3% conductivity, ±10% temperature, turbidity, and DO. Disconnect in-line water quality meter prior to sampling.

Sample Parameter	Sample Volume	Bottle Type	Number of Bottles	Preservation/Prep

Comments/Observations/Weather Conditions: Partly Cloudy 60°
Stability Reached: 1320

Low Flow Sampling: Well purge flow rate of approximately 0.5L/min or less. Collect in-line water quality measurements and depth to water measurements every 3 to 5 minutes. If excessive drawdown (>0.5 ft.), reduce purge rate (0.2 L/min). Stabilization with three successive readings of ± 0.1 pH, ±3% conductivity, ±10% temperature, turbidity, and DO. Disconnect in-line water quality meter prior to sampling.

Sample Parameter	Sample Volume	Bottle Type	Number of Bottles	Preservation/Prep
VOC	120 mL	40ml VOA	3	HCl

Comments/Observations/Weather Conditions: Sunny, mid 60's, wind 5-10mph from South
Stability Reached 1430

Low Flow Sampling: Well purge flow rate of approximately 0.5L/min or less. Collect in-line water quality measurements and depth to water measurements every 3 to 5 minutes. If excessive drawdown (>0.5 ft.), reduce purge rate (0.2 L/min). Stabilization with three successive readings of ± 0.1 pH, ±3% conductivity, ±10% temperature, turbidity, and DO. Disconnect in-line water quality meter prior to sampling.

GROUND WATER SAMPLING
FIELD DATA FORM

Site: Genuine Parts
Location: Indianapolis, IN
Job #: 2125641D

Well #: MW-1755
Sample I.D. #: MW-1755
Sample Time: 1555
Sample Date: 9-13-11

Personnel Present During Sampling:
Chris Ferguson, ENVIRON

Well/Purging Information:

Purging method: _____
Sampling method: Low-Flow
Tubing material: _____
Screen Length: _____ ft.
Top of well screen; _____ ft. below measuring point
Pump intake set at: _____ ft. below measuring point
Casing radius: _____ in.
Well material: PVC / #316 SS / Galv. Steel
Other: _____

1) Well depth (from top of measuring point) (1) _____ (ft)
2) Depth to water prior to purging (2) 22.15 (ft)
3) Length of water column in well: #1 - #2 = (3) _____ (ft)
4) Volume of water standing in well (4) _____ (gal)
multiply #3 by 0.1632 for 2" ID and 0.0408 for 1" ID wells.
(Required for well volume purging approach only)
5) Number of purge volumes required (5) _____
6) Maximum volume to be purged: #4 x #5 = (6) _____ (gal)

Bladder Pump Controller Settings (if used): Recharge time: -- (sec) Discharge time: -- (sec) Pressure: -- (psi) Cycles per minute: --

Stabilization:

RE: Project: Genuine Parts-Olin Ave.
Pace Project No.: 5045903

Dear Mr. Gremos:
Enclosed are the analytical results for sample(s) received by the laboratory on February 18, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Mick Mayse

QUALIFIERS

Project: Genuine Parts-Olin Ave.
Pace Project No.: 5045903

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-I	Pace Analytical Services - Indianapolis
PASI-K	Pace Analytical Services - Kansas City

ANALYTE QUALIFIERS

1d	Multiple compounds RPD's are outside of the required control limits. Refer to the LCS for system control and data acceptability. slb022211
L3	Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
R1	RPD value was outside control limits.

RE: Project: Genuine Parts/2125641D
Pace Project No.: 5050644

Dear Mr. Gremos:
Enclosed are the analytical results for sample(s) received by the laboratory on July 13, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Mick Mayse

QUALIFIERS

Project: Genuine Parts/2125641D
Pace Project No.: 5050644

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

C0	Result confirmed by second analysis.
L3	Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
N2	The lab does not hold TNI accreditation for this parameter.
R1	RPD value was outside control limits.
R2	RPD value was outside control limits due to matrix interference

RE: Project: Genuine Parts
Pace Project No.: 5050763

Dear Mr. Gremos:
Enclosed are the analytical results for sample(s) received by the laboratory on July 18, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kelly M Jones

QUALIFIERS

Project: Genuine Parts
Pace Project No.: 5050763

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

N2 The lab does not hold TNI accreditation for this parameter.

RE: Project: Genuine Parts
Pace Project No.: 5052592

Dear Frank West:
Enclosed are the analytical results for sample(s) received by the laboratory on September 12, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Mick Mayse

QUALIFIERS

Project: Genuine Parts
Pace Project No.: 5052592

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

1d	Several compounds are outside of the acceptance limits for RPD value. Refer to batch QC for system control. aa 9/16/11
N2	The lab does not hold TNI accreditation for this parameter.

RE: Project: Genuine Parts/2125641E
Pace Project No.: 5052702

Dear Frank West:
Enclosed are the analytical results for sample(s) received by the laboratory on September 15, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Mick Mayse

QUALIFIERS

Project: Genuine Parts/2125641E
Pace Project No.: 5052702

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

1d	Multiple compounds are outside the MS/MSD RPD control limits. HEB 9/16/11
N2	The lab does not hold TNI accreditation for this parameter.

RE: Project: Genuine Parts/2125641E
Pace Project No.: 5052819

Dear Frank West:
Enclosed are the analytical results for sample(s) received by the laboratory on September 16, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Mick Mayse

QUALIFIERS

Project: Genuine Parts/2125641E
Pace Project No.: 5052819

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
N2	The lab does not hold TNI accreditation for this parameter.
