SUBJECT: SABANA ABAJO INDUSTRIAL PARK SITE: PHASE II - SOURCE LOCATION
IDENTIFICATION, WORK ASSIGNMENT 0-111 - TRIP REPORT

BACKGROUND AND OBJECTIVES

The Sabana Abajo Industrial Park Site (Site) is located in Carolina, Puerto Rico. The Site is bounded to the north by Avenue Iturregui, to the west by a section of the Suarez Canal (a lined canal), to the south by York Property and to the east by Calle B (Figure 1). The Site is located in an Industrial Park that includes a number of active manufacturing, pharmaceutical, storage, other commercial facilities, and the two potentially responsible party (PRP) facilities owned by Biovail and Gillette respectively. The park is built on poorly sorted fill underlain by clayey and silty alluvium. Chlorinated hydrocarbon contamination of over 300,000 micrograms per liter ($\mu\text{g}/\text{L}$) in groundwater and over 400,000 micrograms per kilogram ($\mu\text{g}/\text{kg}$) in soil persist in the shallow subsurface on the Gillette facility within the industrial park.

Response Engineering and Analytical Contract (REAC) personnel provided technical assistance to the Environmental Protection Agency (EPA) Region II On Scene Coordinator (OSC) at the request of the EPA/Environmental Response Team (EPA/ERT) during the subsurface assessment to identify the source of the chlorinated solvent contamination. This trip report summarizes the second phase of work performed at the Site; the first phase was conducted in January 2005 as summarized below (Lockheed Martin 2005).

The first phase of this investigation was conducted between January 10 and 22, 2005 (Lockheed Martin, 2005). During the first phase of this project, ERT/REAC personnel installed and sampled 55 temporary monitor wells across the industrial park. In addition to the temporary monitor wells, ten permanent monitor wells previously installed on the Gillette Property were also sampled. The groundwater analytical data indicated a dissolved chlorinated hydrocarbon plume on the Gillette and Biovail properties with the center of the plume between the Gillette and Biovail buildings. Dissolved tetrachloroethene (PCE) and trichloroethene (TCE) concentrations ranged up to 67,000 $\mu\text{g}/\text{L}$ and 93,000 $\mu\text{g}/\text{L}$, respectively.

0111-DTR-100506

In addition to TCE, other breakdown products of PCE (1,1 dichloroethene [1,1-DCE], cis 1,2 dichloroethene [cis 1,2-DCE], trans 1,2 dichloroethene [trans 1,2-DCE], and vinyl chloride [VC]) were also identified in the groundwater samples. Based on the distribution of the dissolved chlorinated plume, it was inferred that the source of the contamination was between the Bovail and the Gillette buildings, but more likely on the Bovail property.

The primary objective of this second phase of this project, conducted between April 3 to 11, 2006, was to further delineate the source of contamination. To achieve this objective, a focused soil sampling effort was conducted in the alley between the Gillette and the Bovail buildings. The secondary objective of this project was to install permanent monitor wells at the soil boring locations on the Bovail Property to form a network with existing wells on the Gillette Property. This would provide an expanded shallow extent of contamination and a repeatable method for sampling groundwater from these properties and an assessment of groundwater elevations.

OBSERVATIONS AND ACTIVITIES

Soil Borings and Sampling.

A local contractor, GeoEnviroTech, Inc., hired by Weston Solutions Removal Support Team (RST) used direct push methodology to continuously collect soil samples from eleven soil borings (MW-34 to MW-41 and SB-41 to SB-44) on the Bovail and Gillette properties (Figure 2). Eight of the soil borings were located on the Bovail Property and three on the Gillette Property. The soil samples were collected in acetate sleeves in five-foot increments down to a depth of 15-foot below ground surface (bgs). Not all locations could be sampled to the maximum depth of 15-foot, because of refusal. Each soil core was logged and soil stratigraphy and texture were recorded in a field logbook. The soil cores were screened for total volatile organic compounds (VOCs) using a photo-ionization detector (PID). The soil descriptions and PID readings were recorded in field logbooks (Appendix A). Core sections with elevated PID readings were sampled, by transferring the appropriate section of soil boring to a labeled glass jar. Eighteen soil samples were collected from eight of the eleven soil boring locations. No samples were collected at locations MW-34, MW-35 and MW-36, as there were no elevated PID readings at these locations.

All soil samples were collected in accordance with the ERT/REAC SOP #2012, *Soil Sampling*. All soil samples were maintained and shipped on wet ice at a temperature of approximately 4 degrees Celsius (°C) under chain of custody procedures specified in REAC SOP #4005, *Chain of Custody Procedures*. Matrix spike/matrix spike duplicate (MS/MSD) samples, trip blanks, and field blanks were collected and analyzed as specified in ERT SOP #2005, *Quality Assurance/Quality Control Samples*. Samples were analyzed for VOCs at the REAC Laboratory in Edison, New Jersey (NJ). The REAC data validation group validated all laboratory data and the final analytical results are contained in summary tables and in the Final Analytical Report (Appendix A). Split soil samples were provided to the respective PRP's contractor at their request.

Monitor Well Installation and Sampling.

Eight of the soil borings (MW-34 to MW-41) were converted to two-inch diameter monitor wells (Figure 2). All newly installed wells were constructed to a depth of 15 feet bgs with the bottom 10 feet of the well consisting of 10 slot PVC screen (Figure 3). Seven of the new monitor wells were installed on the

Biovail Property and one of the new monitor wells was installed on the Gillette property. After the wells were installed, an initial round of sampling and water table elevation measurements were completed.

After a minimum of 24 hours after installation, GeoEnviroTech, following their internal procedures used over-pumping to develop all the newly installed monitor wells. After development, all wells were given a minimum of 24-hours to recover before they were purged and sampled by ERT/REAC personnel. All monitor wells were purged a minimum of three well volumes of water or until they were dry. Wells that were purged dry were given time to recover prior to sampling. All wells were sampled within 12 hours after purging, with most wells being sampled within less than one hour after purging. Sampling was performed using peristaltic pumps and dedicated Teflon® tubing. The pump flow rate was set as low as possible to avoid aeration of the sample. Samples were collected directly into labeled 40-milliliter (mL) glass volatile organic analysis (VOA) vials.

All groundwater sampling was conducted in accordance with REAC SOP #2007, *Groundwater Sampling*. All samples were maintained and shipped on wet ice at a temperature of approximately 4 ° C under chain of custody procedures specified in REAC SOP #4005, *Chain of Custody Procedures*. Trip blanks, field blanks and MS/MSD samples were collected and analyzed as specified in ERT SOP #2005, *Quality Assurance/Quality Control Samples*. Field logbook notes are contained in Appendix A. Groundwater samples were analyzed for VOCs at the REAC Laboratory in Edison, NJ. The REAC data validation group validated all laboratory data and the final analytical results are contained in summary tables and in the Final Analytical Report (Appendix A). Split soil samples were provided to the respective PRP's contractor at their request.

Monitor Well and Groundwater Elevation Survey.

All monitor wells (new and previously installed) were surveyed using a differential Global Positioning System (dGPS) and an automatic level. A Trimble PRO XRS dGPS was used to obtain the horizontal position for all soil boring and monitor well locations. Elevations from the top of casings (TOC) for all monitor wells and ground elevations were surveyed using a Topcon Automatic Level (Appendix A). Two points in the Suarez Canal, one located near the midpoint of the back of the Biovail property (Canal1) and one near the midpoint of the back of the property of Gillette (Canal2), were also surveyed and stream staff gages were installed at these locations. An arbitrary elevation of 100.98 feet was assigned to a benchmark (STA 5, Jorge Diaz & Assoc., Land Surveyors) on the Biovail property and all features were surveyed relative to this benchmark. Maximum loop misclosure for each survey was less than 0.01 foot.

A groundwater interface probe was used to measure the depth to groundwater from the TOC in all new and existing monitor wells. Two sets of groundwater level measurements were collected, one on April 8, 2006 and a second set on April 11, 2006. The groundwater elevations collected on April 11, 2006 contained a complete set of data; however, two wells on the Gillette property were not accessible for the April 8, 2006 survey.

RESULTS AND DISCUSSION

Monitor Well and Groundwater Elevation Survey

Table 1 summarizes the results of the monitor well and groundwater elevation survey. Figure 4 shows groundwater elevation contours developed from the interpolated groundwater elevation data for April 11,

2006 as given in Table 1. Groundwater appears to flow from the Biovail and Gillette properties in generally a westerly direction towards the Suarez Canal. Groundwater elevations on April 11, 2006 ranged from 97.8 feet on the eastern side of the site at MW-6 to 95.7 feet on the western side of the site at MW-21 near the Suarez Canal. At the time of this investigation, the water levels in the canal were lower than the adjacent water table elevation indicating that groundwater may be entering the canal from the site. This observation is based on one set of water level measurements; seasonal changes may affect the migration pattern of the groundwater.

Soil Investigation

Table 2 summarizes the PID field screening and analytical results for the VOCs detected in the soil samples. The field screening PID data is contained in the field logbook notes (Appendix A) and the laboratory data is contained in the Final Analytical Report (Appendix B).

The primary compounds detected in the soil samples were PCE, TCE, cis 1,2-DCE and VC. The compound with the highest concentration was PCE (2,620,000 µg/kg) followed by cis 1,2-DCE (62,700 µg/kg) and TCE (31,100 µg/kg) and VC (6,960 µg/kg). Several other VOCs (acetone, 1,1-dichloroethene, methylene chloride and trans-1,2-dichloroethene) were detected in limited soil samples and at relatively low concentrations (219 µg/kg or less).

Figure 5 plots the concentrations of total chlorinated compounds detected in soil samples. The highest soil concentration (2,700,00 µg/kg) for total chlorinated compounds was found on the Biovail property at MW-39 at a depth of 6.5 to 7.0 feet. The total chlorinated compounds in this sample consisted primarily of PCE (97.9%) with lesser concentrations of TCE (1.2%) and cis 1,2-DCE (0.9%). Total chlorinated compound concentrations in this sample was more than an order of magnitude higher than in any soil boring sample collected during this investigation. In fact, the three highest concentrations of chlorinated compounds in soil were found at MW-39.

On the Gillette property, the highest soil concentration of chlorinated compounds was found at MW-41 at a depth of 8.5 to 9.0 feet. This concentration is an order of magnitude lower than the highest concentration observed at MW-39, which is located on the Biovail property about 10 feet to the south of MW-41. Also, the highest concentration of chlorinated compounds at MW-41 is found at a greater depth than the highest concentration of chlorinated compounds at MW-39. This trend in concentration and depth indicate that the source area is near or upgradient of MW-39 on the Biovail property.

The total chlorinated hydrocarbon concentration in soil collected from MW-39 at the 15-foot depth was 260,000 µg/kg. Based on this, it appears that the contamination may also extend below the maximum depth sampled during this investigation.

The high concentrations of volatile organic compounds detected in the soil samples indicate that residual dense nonaqueous phase liquid (DNAPL) is likely present at the source in the shallow subsurface (less than 6.5 feet bgs). The sharp drop in soil concentrations of chlorinated compounds from the highs in soil borings proximal to MW-39 (i.e., soil borings MW-41, MW-42, MW-43 and MW-44) suggests a point source of limited area. Also, it appears that the source is limited to the area between north of the Biovail Building and south of the perimeter fence dividing the two properties; based on the relatively low concentrations of chlorinated compounds detected in samples collected at SB-44 (to the south) and MW-41, MW-42, and MW-43 (to the north). This observation is based solely on one sample collected south of

the source area. The extent of the source to the east and west, although slightly less defined, is constrained by the data from soil borings collected at MW-40 (to the east) and MW-38 (to the west).

Groundwater Investigation

Table 3 summarizes the analytical results for the VOCs detected in the groundwater samples. All analytical methods and results are contained in the Final Analytical Report (Appendix B). As with the soil samples, the primary compounds detected in the groundwater were PCE, TCE, cis 1,2-DCE, and VC. The groundwater sample collected at MW-41 on the Gillette property had the highest concentration of dissolved total chlorinated hydrocarbons (470,000 µg/L) and also the highest concentrations of cis 1,2-DCE (323,000 µg/L) and TCE (42,900 µg/L). The groundwater sample with the highest PCE (88,900 µg/L) and VC (42,700 µg/L) concentrations was collected on the Gillette property at location MW-06. Other chlorinated compounds detected in the groundwater samples included 1,1-DCE, 1,1-dichloroethane (1,1-DCA), chlorobenzene, and 1,2-dichlorobenzene (1,2-DCB). These contaminants were only detected in three of the groundwater samples and were detected at relatively low concentrations (14 µg/kg or less).

As specified in the Final Analytical Report (Appendix B), PCE was detected in a trip blank collected on 8 April 2006 and in a method blank (041206-1) analyzed on 12 April 2006. Due to the PCE contamination in these blank samples, the results for samples 19450 through 19455 and 19664 were reported as non detect and the PCE reporting limits (RL) were raised for these samples. It should be therefore noted that PCE concentrations up to RL may exist at these locations, but were reported as non detect in the Final Analytical Report. Locations impacted by this included MW-2 (RL = 15,100 µg/L), MW-2 Dup (RL = 15,400 µg/L), and MW-17 (RL = 5,310 µg/L).

Figures 6 through 8 are color contour maps of dissolved total chlorinated compounds, PCE and TCE concentrations in groundwater. The maps were developed from the concentration data in Table 3 using Spatial Analyst module in ERSI® ArcMap™ Version 9.0. The concentration used for MW-39 is the arithmetic mean of the MW-39 sample and its duplicate.

In all three figures, the general shape and orientation of the contaminant plumes are similar. The contaminant plumes appear to be moving from the Biovail to the Gillette property with an elongate trend towards the Suarez Canal, likely caused due to the prevailing groundwater flow direction. The highest dissolved VOC concentrations are generally confined to an area between MW-17/MW-2 to the west and MW-40 to the east. All locations outside this area to the north, south and west had total chlorinated compound concentration at or below 130 µg/kg, PCE concentrations at or below 48 µg/kg and TCE concentrations at or below 19.6 µg/kg. The relatively low level of VOCs detected at sample locations between the plume and the Suarez Canal either indicate a very confined plume or possibly the wells were not deep enough to intercept the plume.

CONCLUSIONS AND RECOMMENDATIONS.

Based on the results of this investigation, it appears that primarily a PCE residual DNAPL source exists in the shallow subsurface on the Biovail Property near or upgradient of MW-39. A dissolved chlorinated hydrocarbon plume emanates from this source to the shallow groundwater. The dissolved plume has migrated onto the Gillette Property with a northwesterly orientation towards the Suarez Canal. The

residual DNAPL, if not remediated, will continue to act as a source for dissolved chlorinated hydrocarbons in the groundwater for a very long time. The DNAPL source appears to be point source and does not appear to extend beneath the Biovail Building (based on results from SB-44).

Additional monitor wells should be installed at a greater depth between the plume and the Suarez Canal to confirm that the contamination is confined to the areas shown on Figures 6 through 8 and the plume is not just passing below the 15-foot deep monitor wells (MW-21, MW-36, and MW-35) previously installed in this area. If contaminants are not detected in these additional wells, the source would then not extend much beyond the 15-foot depth (near or upgradient of MW-39), and groundwater can be excluded from remedial actions. Excavation would be an attractive remedy to address the VOC contamination on the Biovail and Gillette properties but in-situ treatment should also be considered.

Additional monitoring of water levels and sampling of groundwater in the monitor well network is recommended to verify the results obtained during this mobilization and evaluate seasonal trends. Additionally, soil sampling in the vicinity of MW-39 is recommended to determine the horizontal and vertical extent of contamination. This could be done during the remedy phase or excavation with field screening techniques.

Introduction

REAC in response to WA 0-111, provided analytical support for environmental samples collected from Sabana Abajo Industrial Park PCE, Site located in Carolina, Puerto Rico described in the following table. The support also included QA/QC, data review, and preparation of an analytical report containing a summary of the analytical methods, the results, and the QA/QC results.

The samples were treated with procedures consistent with those specified in SOP #1008.

COC #	Number of Samples	Sampling Date	Date Received	Matrix	Analysis	Laboratory	Data Package			
07877	11	4/08/2006	4/11/2006	Water	VOC	REAC	R 151			
07877	6	4/10/2006								
07879	8	4/11/2006								
07874	2	4/04/2006	4/06/2006	Soil		REAC	R 152			
	10	4/05/2006								
07873	3	4/06/2006	4/07/2006							
07876	9	4/07/2006	4/11/2006							
	2	4/10/2006								

Case Narrative

The data in this report have been validated to three significant figures. Any other representation of the data is the responsibility of the user. All data validation flags have been inserted into the results tables.

VOC in Water Package R 151

The trip blank 19459 (4/8/06) and method blank 041206-1 contained tetrachloroethene, The tetrachloroethene results for samples 19450 through 19455 and 19664 are reported as non detect and the RLs are raised because the sample results were less than 5 times the blank concentration.

The reporting limit was less than four times the y-intercept for the cis-1,2-dichloropropene, bromoform, 4-methyl-2-pentanone, 2-hexanone, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene and naphthalene regression equations. The RLs for these compounds are based on four times the y-intercept of the regression equations for all samples and method blanks.

In the initial calibration of 3/31/06 the relative percent difference were exceeded for bromomethane and acetone. All bromomethane results for all samples are estimated. The acetone result for method blank 041406-1 is estimated.

In the continuing calibration on 4/11/06 the percent difference were exceeded for bromomethane, chloroethane and trichlorofluoromethane. The trichlorofluoromethane results for method blank 041106-02, samples 19458 through 19460, 19456 and 19457 are estimated.

In the continuing calibration on 4/14/06 the percent difference were exceeded for dichlorofluoromethane, bromomethane, acetone and 2-hexanone. The acetone result for method blank 041406-1 is estimated.

VOC in Soil Package R 152

Soil method blank B040706-1 contained acetone. The acetone results for the associated samples 19439 and 19440 are reported as non detect because the sample results are less than ten times the blank concentration.

Methanol method blank B041206-1 contained acetone. The acetone results for the associated samples 19444 is reported as non detect because the sample concentration was less than ten times the blank concentration.

Trip blank 19449 contained cis-dichloroethene, vinyl chloride and tetrachloroethene. The cis-dichloroethene and vinyl chloride results are reported as non detect for sample 19448 because the sample concentration was less than five times the blank concentration.

Initial calibration-(WN0411B)-04/11/06 (System B): The Relative Response Factor exceeded acceptable criteria for 1,2-dibromo-3-chloropropane at 5 ppb. The reporting limit for this compound was raised to 20 ppb for associated samples.

Initial Calibration- 04/03/06 (System A): The linear regression for dichlorofluoromethane, chloroethane, trichlorofluoromethane, bromoform, 1,3,5-trimethylbenzene and 1,2-dibromo-3-chloropropane showed the y-intercept above the lowest concentration of the calibration curve. The RLs for these compounds are based on four times the y-intercept of the regression equations for samples 19429, 19430, 19426, 19432 through 19435 and methanol blanks A -040606-1 and A-040706-2.

Initial Calibration- 04/03/06 (System B): The linear regression for bromoform, 1,2-dibromo-3-chloropropane and 1,2,4-trimethylbenzene showed the y-intercept above the lowest concentration of the calibration curve. The RLs for these compounds are based on four times the y-intercept of the regression equations for samples 19427, 19428, 19431, 19436, 19437, 19439, 19440, 19438, 19461, 19448, 19449, 19468, 19446, 19445 and soil blanks B040606, B040706 and B041106.

Initial Calibration- 04/11/06 (System B): The linear regression for bromoform, 1,2-dibromo-3-chloropropane, 4-methyl-2-pentanone, 2-hexanone, 1,2,4-trichlorobenzene and naphthalene showed the y-intercept above the lowest concentration of the calibration curve. The RLs for these compounds are based on four times the y-intercept of the regression equations for samples 19441 through 19444 and methanol blank B-041206-01.

Initial Calibration- 04/12/06 (System B): The linear regression for bromoform, cis-1,2-dichloropropene, naphthalene, 1,2-dibromo-3-chloropropane, 4-methyl-2-pentanone and 1,2,4-trichlorobenzene showed the y-intercept above the lowest concentration of the calibration curve. The RLs for these compounds are based on four times the y-intercept of the regression equations for samples 19447and soil blank B-041206-2.

Initial Calibration 04/03/06 (System A): The acceptable QC limits for %RSD was exceeded for bromomethane and acetone . Bromomethane results are estimated (UJ) for samples 19426, 19429, 19430, 19432 through 19435 and methanol blanks A040606-1 and A040706-2.

Continuing Calibration-04/07/06 (System A): The percent difference exceeded the acceptable QC limits for chloroethene and trichlorofluoromethane. Trichlorofluoromethane results are estimated for methanol blank A040706-2 and 19435.

Continuing Calibration-04/12/06 (System B): The percent difference exceeded the acceptable QC limits for acetone. Acetone results are estimated for sample 19447.
