Trip Report  
Sabana Abajo Industrial Park  
Former Biovail Carolina Facility  
Carolina, Puerto Rico  
Radiation Data Project No. 05-0001D

Dear Mr. Rosoff:

This letter report provides a documentation of communication testing, indoor air monitoring, and indoor air sampling conducted between April 23, and April 24, 2015, and summarizes the results of the system performance evaluation conducted between April 23, and April 24, 2015 in the Former Biovail Carolina Facility located in the Sabana Abajo Industrial Park, Carolina, Puerto Rico. This letter includes a description of air sampling activities, a summary of the system performance evaluation, a summary of the indoor air monitoring and sampling results, and a description of proposed future performance verification and sampling activities.

## **1.0 INTRODUCTION**

In 2014, Radiation Data was retained by International Process Plants (IPP) to conduct additional assessment and remediation activities at the former Biovail Laboratories International SRL (Biovail) facility on behalf of Valeant International Bermuda (Valeant), formerly Valeant International (Barbados) and Biovail Laboratories International SRL. The former Biovail facility is located within the Sabana Abajo Industrial Park (SAIP) in the Sabana Abajo Ward, Carolina, Puerto Rico. From here-on, the former Biovail facility will also be referenced as the subject site, the subject facility or the Site. The site location can be seen in Figure 1. The subject site is now being used by Accuprint as a commercial printing operation.

The U.S. Environmental Protection Agency (EPA) has conducted, overseen, or received various assessment activities within the Industrial Park and based upon the results of these assessment activities, the EPA has identified chlorinated volatile organic compounds (CVOC) in soil and groundwater underlying both the former Gillette and Biovail properties. In particular, Trichloroethene, Tetrachloroethene, CIS-1-2 Dichloroethene and Vinyl Chloride were identified as the contaminants of concern (COC).

Radiation Data installed 3 sub-slab depressurizations systems at the site from February 24, 2015 through February 27, 2015, in accordance with the Remedial Action Workplan for the Installation of a Sub-Slab Depressurization/Ventilation System, which was approved in November 2014. The system layout can be seen in Figure 2.

Radiation Data personnel mobilized to the site on April 23, 2015 to perform 24-hour indoor air sampling, communications testing, and indoor air monitoring at the Site.

## **2.0 SUMMARY OF FIELD ACTIVITIES**

### **2.1 INDOOR AIR MONITORING**

Upon arrival at the Site, Radiation Data personnel began conducting indoor air monitoring using a PID. There were fluctuations in the VOC levels present inside the building, and in the sub-slab spaces. On the main floor of the print operation, throughout the installation, VOC levels ranged

Trip Report  
Sabana Abajo Industrial Park  
Former Biovail Carolina Facility  
Carolina, Puerto Rico  
Radiation Data Project No. 05-0001D

from approximately 35 ppm up to 85 ppm, with the vast majority of the time spent between 55 and 70 ppm. In the warehouse portion of the site, levels fluctuated between 10 ppm and 30 ppm. In the office portion of the building, levels ranged from as low as 3.0 ppm up to approximately 15 ppm. There were significantly elevated readings recorded directly near several of the larger pieces of printing equipment. With the wand of the PID placed inside of the larger printing equipment, the PID registered readings of as high as 15,000 ppm. The indoor air sampling included TICs (tentatively identified compounds) in an attempt to differentiate these compounds, as it appears the indoor air concentrations of VOCs detected by the PID are primarily driven by the printing processes currently being used at the site as opposed to as a result of vapor intrusion. The indoor and ambient air sampling results also indicate that the PID readings are a result of the printing processes at the site.

## **2.2 OUTDOOR AIR MONITORING**

Aside from directly next to the diesel generators, which were providing the building power, and directly in front of the sub-slab depressurization system vent stacks after the systems had been turned on, the PID did not register any VOC concentrations in the outdoor work area. Near the exhaust stacks from the sub-slab depressurization systems, the PID registered levels between 35.0 to 115.0 ppm. With the wand of the PID inserted into the vent stack, values ranged from approximately 100 ppm at System 1, to approximately 75 ppm at System 2 and approximately 65 ppm at System 3. The generator exhaust registered over 1200 ppm,, as noted during the installation, and the area directly around the generator registered values between 0.0 and 10.0 ppm.

## **2.3 SUB-SLAB AIR MONITORING**

PID readings were also taken at each suction point for the sub-slab depressurization system, and at each test hole. The deflection of PID readings over background at each test hole was recorded, and is summarized in Table 1. The soil gas at these locations will be monitored again during every round of sampling.

## **2.3 COMMUNICATION TESTING AND PERFORMANCE VERIFICATION**

Cross-slab communication test holes were installed on February 26, 2015 distributed throughout the building space, focused on the northern portion of the slab, as shown on Figure 3. A total of 18 cross-slab communication test ports were installed, with 7 in closest proximity to System 1 where communication was viewed as likely to be the poorest, 6 in closest proximity to System 2, and 5 in closest proximity to System 3, where communication was viewed as likely to be the strongest, based on sub slab data. On April 23 and 24, 2015, Radiation Data collected additional micomanometer data to assess the depressurization of the sub-slab space. The communication holes, which had been filled with a foam backer rod, then had more permanent plastic caps installed. These caps are designed to be removed and replaced to conduct communication sampling throughout the project. Depending on the durability of the caps, more permanent ports may need to be installed at a later date.

Trip Report  
Sabana Abajo Industrial Park  
Former Biovail Carolina Facility  
Carolina, Puerto Rico  
Radiation Data Project No. 05-0001D

System performance was evaluated on April 24, 2015, beginning immediately after the indoor air sampling containers were closed. The following was conducted to verify system performance:

- A system inspection was performed. No problems with the fan, piping, or wall/floor sealing were identified. Additional cracks in the floor slab in the warehouse portion of the building were observed, and sealed.
- The differential pressure at the vent pipe riser for each system is being recorded on an ongoing basis by Accuprint personnel, and the historical data was in line with expectations and normal operating pressures for the systems.
- Differential pressure readings were collected for the each of the locations indicated in Figure 4. Tables 2, 3, and 4 show the differential pressure at each communication test port location. Figures 5, 6, and 7 show the relationship between distance from the fan and differential pressure at each communication test port. Figure 8 shows the pressure field extension for each system. Figure 9 shows the difference in communication between February and April 2015.

Based on the communication testing performed following the installation of the sub-slab depressurization systems, and repeated during this sampling event, the entire northern portion of the slab is depressurized, and the vapor intrusion pathway blocked. An additional rounds of communication testing will be performed at the time of future air sampling, and the ports will remain in place so further communication testing can be performed at each air sampling event.

Proving depressurization of the slab may assume added importance if the background contamination in the indoor air interferes with lab analysis for the COCs at the site. While such interference did not occur in this round of air sampling, as printing operations change overtime at the site, background VOC levels inside the Site building may continue to change, and interference with laboratory analysis of air samples may still become a problem.

### **3.0 SUMMARY OF AIR SAMPLING**

Upon arriving at the site, David Rosoff of the EPA, and Kyle Baicker-McKee of Radiation Data walked the site to determine appropriate indoor air sampling locations. Radiation Data personnel conducted performance verification air sampling using EPA Method TO-15 from April 23 to April 24, 2015. On April 23, the SUMMA® canister sampling event was initiated. Seven indoor and one ambient air sampling locations were selected, and the sampling ended 24 hours later on April 24. Eight indoor air samples (7 locations with one duplicate) were collected from the Site building, and one ambient air sample was collected outside the Site building. The indoor air sampling was conducted with one sample location in the warehouse portion of the Site building, three sampling locations in the main print shop area (with the duplicate sample collected at one of these locations), one sampling location in the employee lunch room, and two sampling locations in the management offices of the site. The ambient air sample was collected outside of the main entrance of the Site building. The Air Sampling Locations can be seen on Figure

### **3.1 AIR SAMPLING ANALYTICAL RESULTS**

All the SUMMA® canister samples were analyzed by EMSL Laboratories using the EPA Method TO-15. The Analytical Report is provided in Appendix B. Table 5 presents the analytical results for the COCs at each sampling location. All results are presented in micrograms per cubic meter (pg/m<sup>3</sup>) and parts per billion by volume (ppbv). Of the COCs at the site, Trichloroethene, Tetrachloroethene, CIS-1-2 Dichloroethene and Vinyl Chloride, none were detected above their reporting limits (RL) in any of the samples collected. Some compounds were detected in elevated concentrations, but none associated with the COCs at the site. Compounds such as acetone, ethanol, isopropyl alcohol and MEK were detected at elevated concentrations in multiple samples, but the detected compounds are consistent with those used in commercial printing operations, and appear unrelated to the mitigation being performed. Similarly, significant quantities of unknown hydrocarbons were detected during the indoor air sampling, but these appear to be related to the printing operations at the Site, and not a result of vapor intrusion.

## **4.0 SUMMARY AND PROPOSED FUTURE ACTIVITIES**

### **4.1 JULY INDOOR AIR SAMPLING**

The system performance evaluation indicates that the SSD system is operating as intended, and the absence of any concentrations of the COCs detected during the indoor air sampling supports this hypothesis. In accordance with the Workplan, Radiation Data will conduct indoor air sampling during July, 2015. The sampling locations and methodology used during the April sampling will be repeated during future sampling events unless future circumstances dictate alterations to the sampling plan.

A potential complicating factor for future air sampling at the site is the presence of VOCs in the indoor air related to the printing business that may provide interference with air sampling for the COCs at the site by raising the detection limit for the COCs. During the April sampling event, the laboratory detection limits for the COCs was not interfered with by the high levels of VOCs present in the print shop, but as printing operations change at the site over time, sampling plans may have to be adjusted if future changes to the printing operations increase the indoor air VOC concentrations.

### **4.2 COMMUNICATION TESTING AND SYSTEM INSPECTION**

Sub-slab communication data will be collected again from each test hole following the indoor air sampling for each sampling event. As the systems run, they open up additional air pathways, and the communication improves over the first month of operation, but the testing will be performed following the collection of the air samples. This data will be used to generate a new map of the site showing the region of influence for the three sub-slab depressurization systems.

Trip Report  
Sabana Abajo Industrial Park  
Former Biovail Carolina Facility  
Carolina, Puerto Rico  
Radiation Data Project No. 05-0001D

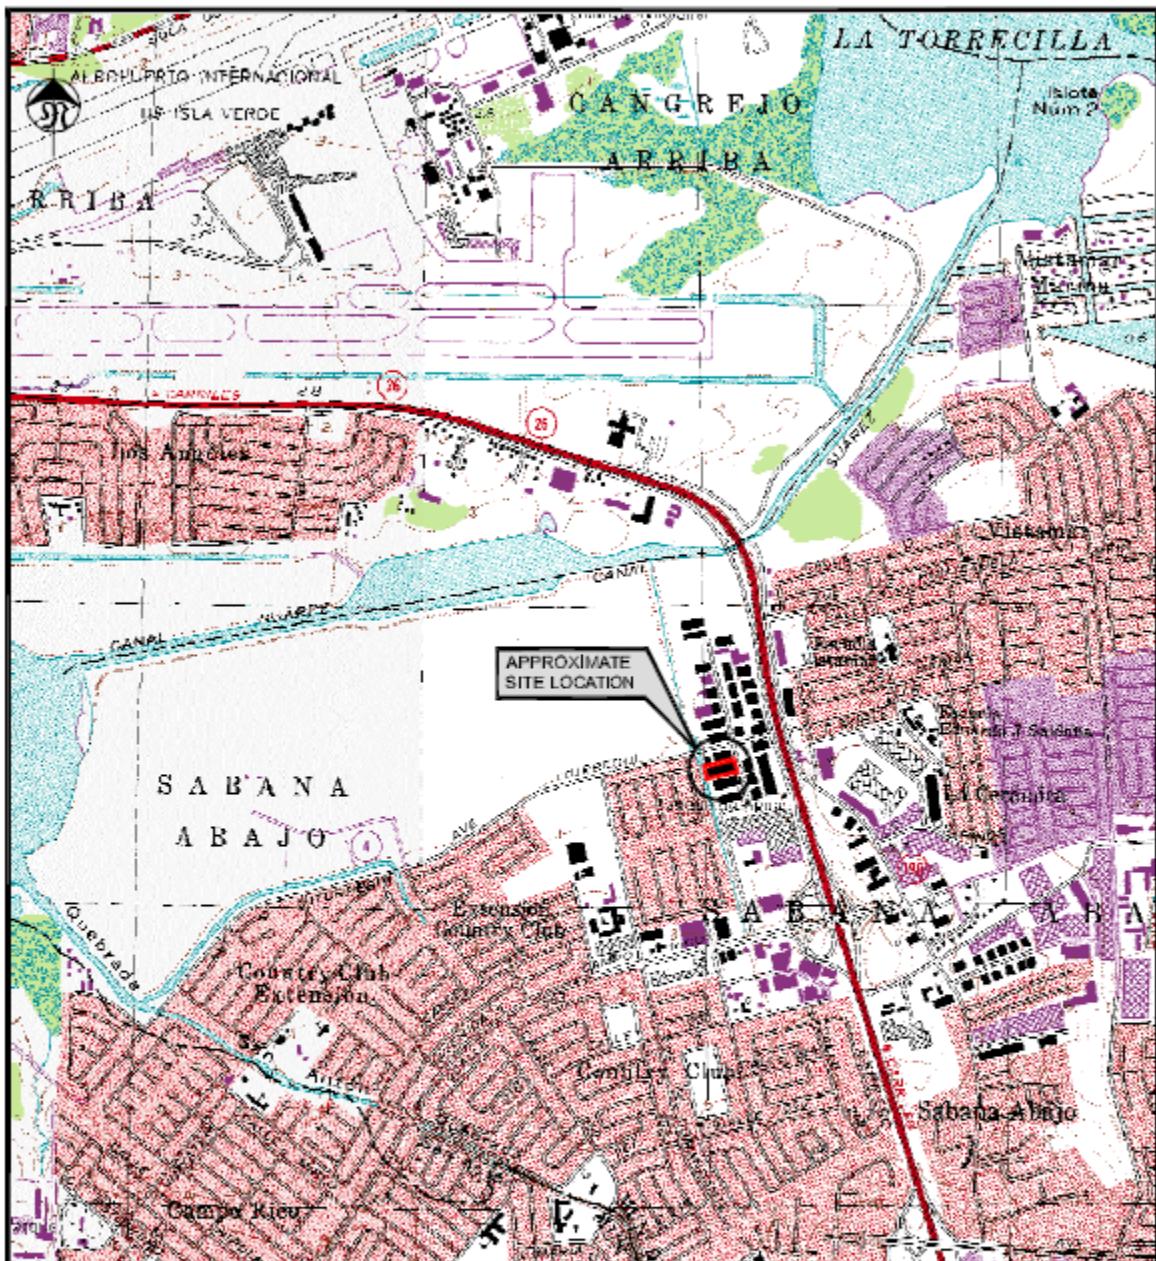

Also, at the next sampling visit, the indoor air will be monitored again with a PID, emissions from the vent stack of all three systems will also be measured with a PID, and PID measurements will be recorded at each communication test hole as well.

Additionally, each of the three systems will be inspected for damage/wear, and any changes to the manometers will be noted.

If you have any questions regarding this correspondence or the upcoming air sampling, please contact me at (609) 466-4300.

Sincerely,

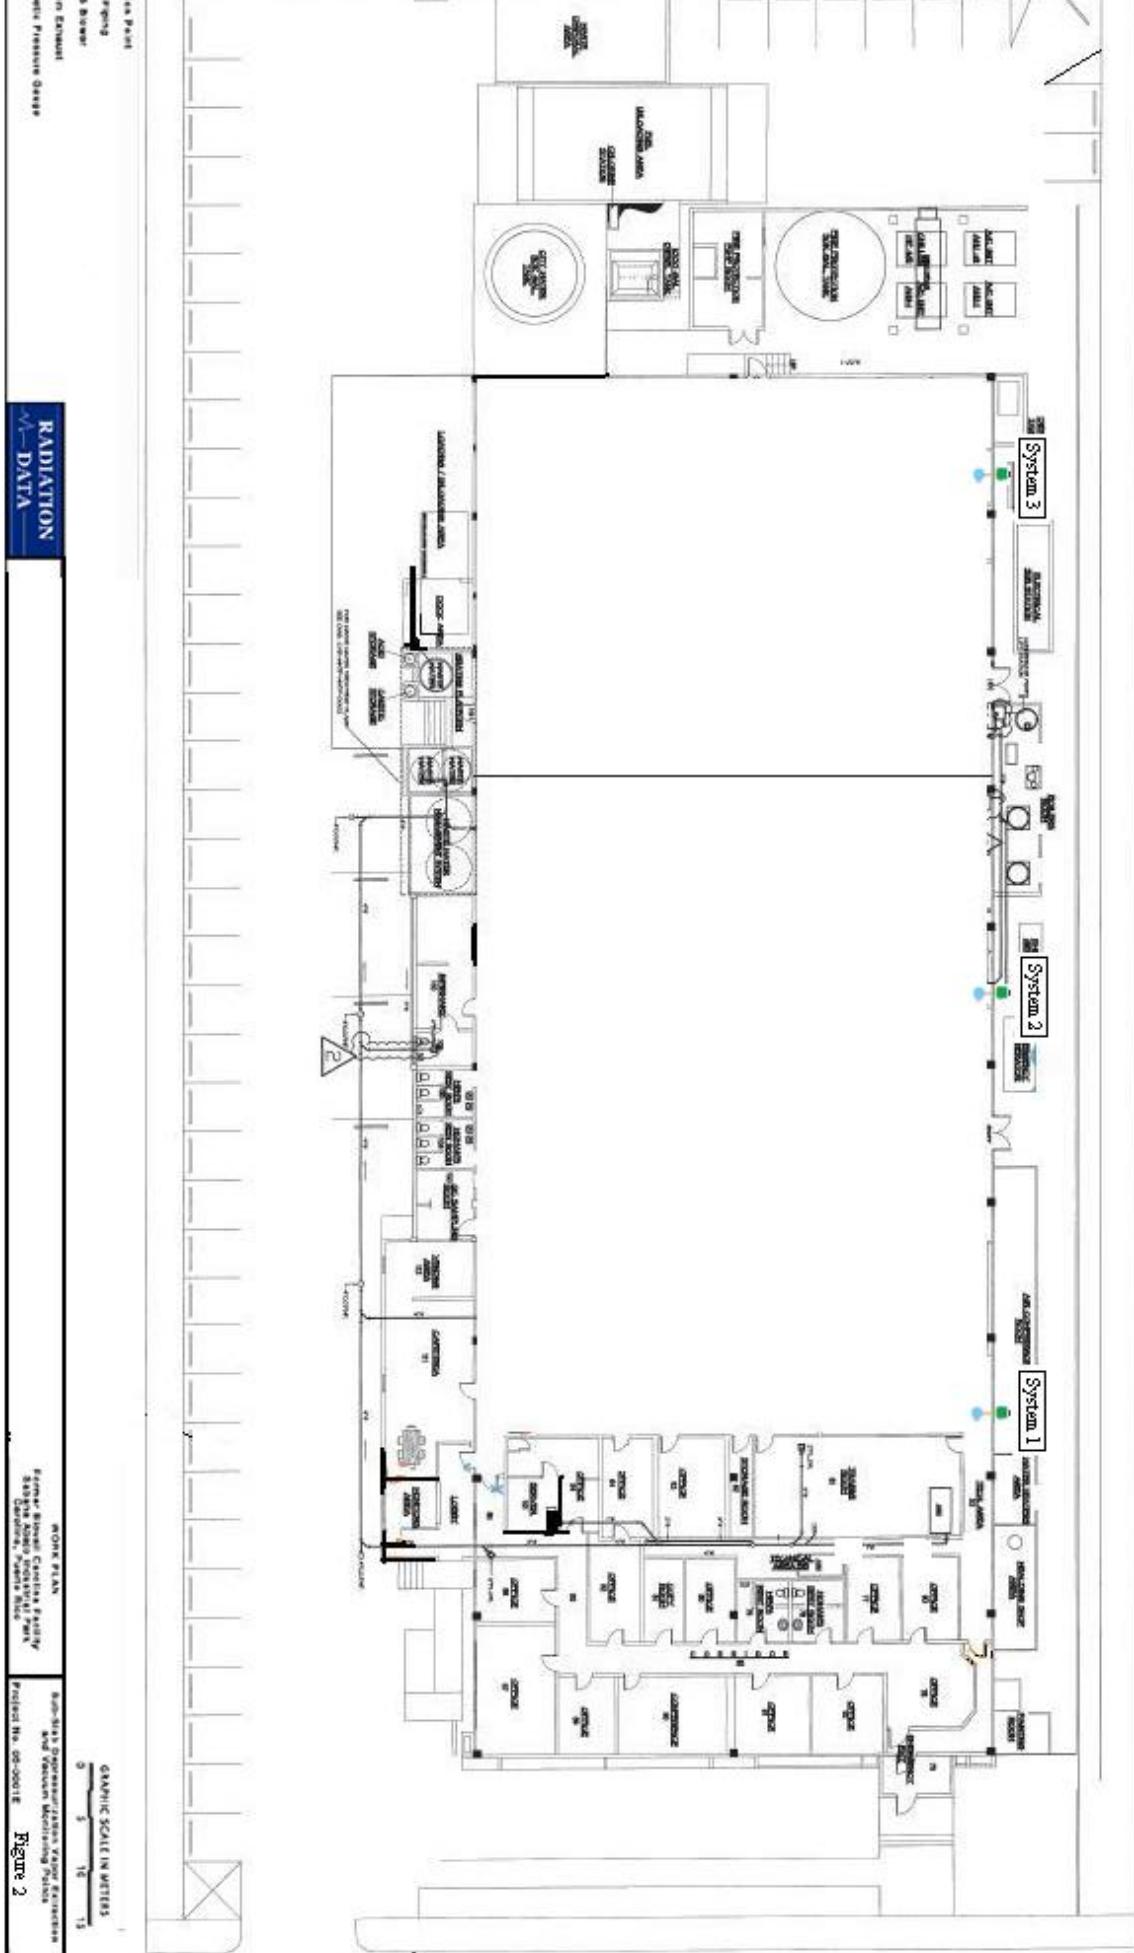

Kyle Baicker-McKee

## Case Narrative

### Method Reference

USEPA: Compendium Method TO-15, "Determination of Volatile Organic Compounds (VOCs) in Air..." Collected in Specially-Prepared Canisters and Analyzed by Gas Chromatography/Mass Spectrometry (GC/MS), January 1999, (EPA/625/R-96/010b).

Restek RTX-502.2, 60m, 0.25mm ID, 1.4um

### Concentrator Traps:

Entech Dual Cold Traps: (1) 1/8" No Packing, (2) 1/8" Tenax.

### Gas Standards:

Certified Spectra Gas standards were used for all analyses.

### Sample Volumes:

Sample volume aliquots for this procedure are 250cc for indoor/ ambient air and 25cc for soil gas. Other volumes for sample dilutions are reflected on each result page.

### Holding Times:

Standard holding times of 30 days were met for all samples.

### Sampling Pressures:

All samples were received at acceptable pressure/ vacuums unless listed below.

### Sample Dilutions:

Dilutions reported are designated by the sample # with a "DL" suffix resulting from initial analysis having compounds exceeding calibration as reported with an "E" qualifier.

Ethanol and Isopropanol are not diluted for and may be reported with an "E" qualifier on the final result.

### QA/QC criteria outside method specifications are listed below (if applicable).

#### Initial Calibration

All Initial Calibration criteria met method specification.

#### Initial Calibration Verification Standard (ICVS)- Second Source

All ICVS's met method specification with 90% of all compounds within the 70-130% recovery range.

#### Continuing Calibration Verification Standard (CCVS)

All CCVS's met method specification with all compounds with 30% deviation.

#### Ending Calibration Verification Standard (ECVS)

All ECVS's met method specification with all compounds with 30% deviation.

#### Method Blanks (MB)

All Method Blanks met method specification with no compounds reported..

#### Instrument Blanks (IB):

IB050515K-A thru IB050515K-L and IB050615K-A and IB050615K-B were analyzed with no compounds reported.

#### Reporting Limit Laboratory Control Samples (RLLCS)

All RLLCS's met method specification with 90% of compounds with in the 70-130% recovery range .

#### Manual Integration: -Listed below if applicable. Before and after documentation is included.

IC041515K-1 (K2966) - 1,4-dioxane, IC041515K-0.5 (K2967) - 1,4-dioxane, acetonitrile

## Case Narrative

**The following data qualifiers that may have been reported with the data.**

**ND**- Non Detect. This notation would be used in the results column in lieu of a "U" qualifier.

**U**- Compound was analyzed for but not detected at a listed and appropriately adjusted reporting level.

**J**- Estimated value reported below adjusted reporting limit for target compounds or estimating a concentration for TICs where a 1:1 response is assumed

**B**- Compound found in associated method blank as well as in the sample.

**E**- Estimated value exceeding upper calibration range of instrument. Ethanol and isopropyl alcohol are not specifically targeted to dilute within calibration range.

**D**- Compound reported from additional diluted analysis.

**N**- indicates presumptive evidence of a compound based on library search match.

**EMSL Analytical, Inc.** certifies that this data package is in compliance with the terms and conditions of this contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer -readable data submitted on diskette has been authorized by the laboratory manager or his/her designee, as verified by the following signature.

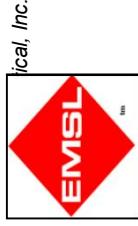

If "Preliminary Report" is displayed in the signature box; this indicates that there are samples that have not yet been analyzed, that are in a preliminary:

**Report Date:**  
05/12/2015

**Report Revision**  
R0

**Revision Comments**  
Initial Report

# Column used to flag values outside QC Limits with an asterisk (\*).

## QC Criteria

Peak Area Upper Limit = +40% of daily 10ppby calibration level internal standard.

Peak Area Lower Limit = -40% of daily 10ppb calibration level internal standard.

RT Upper Limit =  $\pm 0.33$  minutes of daily 10ppby calibration level internal standard.

RT Upper Limit = -0.33 minutes of daily 10ppby calibration level internal standard

## Tentatively Identified Compound Results Summary

## **Qualifier Definitions**

(1) = If unknown, MW is assigned as equivalent Toluene (92) for ug/m<sup>3</sup> conversion purposes.

B = Compound also found in method blank.

J= Estimated value based on a 1:1 response to internal standard.

N= Presumptive evidence of compound based on library match.

## Tentatively Identified Compound Results Summary

## **Qualifier Definitions**

(1) = If unknown, MW is assigned as equivalent Toluene (92) for ug/m<sup>3</sup> conversion purposes.

B = Compound also found in method blank.

J= Estimated value based on a 1:1 response to internal standard.

N= Presumptive evidence of compound based on library match.

## Tentatively Identified Compound Results Summary

## **Qualifier Definitions**

(1) = If unknown, MW is assigned as equivalent Toluene (92) for ug/m<sup>3</sup> conversion purposes.

B = Compound also found in method blank.

J= Estimated value based on a 1:1 response to internal standard.

N= Presumptive evidence of compound based on library match.

## Tentatively Identified Compound Results Summary

## **Qualifier Definitions**

(1) = If unknown, MW is assigned as equivalent Toluene (92) for ug/m<sup>3</sup> conversion purposes.

B = Compound also found in method blank.

J= Estimated value based on a 1:1 response to internal standard.

N= Presumptive evidence of compound based on library match.

## Method Reference

## Tentatively Identified Compound Results Summary

## **Qualifier Definitions**

(1) = If unknown, MW is assigned as equivalent Toluene (92) for ug/m<sup>3</sup> conversion purposes.

B = Compound also found in method blank.

J= Estimated value based on a 1:1 response to internal standard.

N= Presumptive evidence of compound based on library match.

#### Qualifier Definitions

U- Compound was analyzed for but not detected at a listed and appropriately adjusted reporting level.

J- Estimated value reported below adjusted reporting limit for target compounds.

B- Compound found in associated method blank as well as in the sample.

D- Compound reported from additional diluted analysis.

E- Estimated value exceeding upper calibration range of instrument. Ethanol and isopropyl alcohol are not specifically targeted to dilute within calibration range.

## Method Blank- Tentatively Identified Compound Results Summary

USEPA: Compendium Method TO-15, January 1999, (EPA/625/R-96/010b).

Tentatively Identified Compounds	CAS#	MW(1)	Result ppbv	Q	Result ug/m3	Retention Time
----------------------------------	------	-------	-------------	---	--------------	----------------

No Tentatively Identified Compounds (TICs) Reported

### Qualifier Definitions

(1)- If compound is unknown, MW is assigned as Toluene (92) for ug/m3 conversion purposes.

J- Estimated value for TICs based on a 1:1 response to internal standards assumed.

N- Indicates presumptive evidence of a compound based on library search match.

B- Compound found in associated method blank as well as in the sample.

2-Chlorotoluene	95-49-8	126.6	0.50	U	2.6	
1,2,4-Trimethylbenzene	95-63-6	120.2	0.50	U	2.5	
1,3-Dichlorobenzene	541-73-1	147.0	0.50	U	3.0	
1,4-Dichlorobenzene	106-46-7	147.0	0.50	U	3.0	
Benzyl chloride	100-44-7	126.0	0.50	U	2.6	
1,2-Dichlorobenzene	95-50-1	147.0	0.50	U	3.0	
1,2,4-Trichlorobenzene	120-82-1	181.5	0.50	U	3.7	
Hexachloro-1,3-butadiene	87-68-3	260.8	0.50	U	5.3	
Naphthalene	91-20-3	128.17	0.50	U	2.6	
<b>Total Target Compounds:</b>			<b>0.0</b>		<b>0.0</b>	

#### Surrogate

4-Bromofluorobenzene

#### Result    Spike    Recovery

10              10              100%

#### Qualifier Definitions

U- Compound was analyzed for but not detected at a listed and appropriately adjusted reporting level.

J- Estimated value reported below adjusted reporting limit for target compounds.

B- Compound found in associated method blank as well as in the sample.

D- Compound reported from additional diluted analysis.

E- Estimated value exceeding upper calibration range of instrument. Ethanol and isopropyl alcohol are not specifically targeted to dilute within calibration range.

NJDEP Certification #: 03036

EMSL Order: Method Blank  
EMSL Sample ID: MB050615K  
Received Date: NA  
Report Date: 05/28/2015

Project ID: Method Blank  
Lab Sample ID: MB050615K

Sampling Date: NA  
Canister ID: E15636

Lab File ID: K3328.D  
Sample Vol(ml): 250  
Dilution Factor: 1

Analysis Date: 05/06/2015  
Instrument ID: 5973K  
Analyst Initials: KW

## Method Blank- Tentatively Identified Compound Results Summary

USEPA: Compendium Method TO-15, January 1999, (EPA/625/R-96/010b).

Tentatively Identified Compounds	CAS#	MW(1)	Result ppbv	Q	Result ug/m3	Retention Time
----------------------------------	------	-------	-------------	---	--------------	----------------

No Tentatively Identified Compounds (TICs) Reported

### Qualifier Definitions

(1)- If compound is unknown, MW is assigned as Toluene (92) for ug/m3 conversion purposes.

J- Estimated value for TICs based on a 1:1 response to internal standards assumed.

N- Indicates presumptive evidence of a compound based on library search match.

B- Compound found in associated method blank as well as in the sample.

**NJDEP Certification #: 03036**
