

Appendix J

Residential Sampling Results and Yard-Specific Maps

Appendix J

Residential Sampling Results and Yard-Specific Maps

Soil sampling was conducted on residential properties located in the vicinity of the former Iron King Mine and Humboldt Smelter properties and within or near the area of potential site impact (APSI). Multiple phases of sampling were performed, with the most extensive sampling efforts occurring between 2008 and 2012 and between 2013 and 2014. In total, approximately 6,300 soil samples were collected.

This appendix includes a tabulated summary of analytical results, lead concentration figures, and arsenic concentration figures for approximately 490 residential yards sampled as part of the Iron King Mine – Humboldt Smelter Superfund Site investigations. Yards included in both the Residential Yard-Specific Risk (RYSR) and Residential Screening Area Risk (RSAR) sampling are shown on the maps in this appendix.

Soil removal actions were performed at selected residential and municipal properties in 2006 and 2007 by Brown and Caldwell on behalf of Ironite Products Company (Brown and Caldwell, 2007) and in 2011 by EPA (E & E, 2012). To allow a comprehensive evaluation of the current and historical nature, extent, and contaminant transport pathways, pre-removal concentrations are included in this appendix. Because the removed media no longer contributes to risks associated with the Site, however, pre-removal concentrations are excluded from the risk assessments.

Contents

The following tables and figures are included in Appendix J:

Tables

- Table J-1 – Cross Reference for Street Address, Parcel Number, and Yard ID for RYSR and RSAR Areas
- Table J-2 – Summary of Soil Analytical Results for Residential Yards

Figures

- Arsenic Distribution in Surface Soil – Map book with figures illustrating arsenic concentrations in samples collected at each yard
- Lead Distribution in Surface Soil – Map book with figures illustrating lead concentrations in samples collected at each yard

Notes:

The table summarizes all soil sample results, including both surface and subsurface samples.

The screening levels used herein are solely to provide a perspective for identifying the nature and extent of contamination, and they are not intended to infer the existence of unacceptable risk.

RSL = EPA Regional Screening Level for Residential Exposures, equating to 1x10⁻⁶ risk for carcinogens or a hazard quotient (HQ) of 1.0 for noncarcinogens (EPA, 2015a).

The arsenic screening level corresponds to 1x10⁻⁴ risk and incorporates site-specific bioavailability (Section 9.4.5 and Appendix H).

-- = not detected (Columns B and C) or samples were not collected in the area of a removal action (Column K)

mg/kg = milligrams per kilogram

N/A = not available/applicable

UTL = 95th upper tolerance limit

Figures

Arsenic Distribution is Surface Soil

Arsenic Concentration in Surface Soil (mg/kg)

- Not Detected
- 1.8 (Lowest Detection) to 50
- >50 to 112 (Background)
- >112 to 194 (Screening Level)
- >194 to 400
- >400 to 800
- >800 to 1,600
- 1,600 to 1,630 (Highest Detection)
- ⊕ Pre-Removal Soil Sample Location^a

- - - Intermittent Drainage
- ▬ Yard Boundary
- ▬ Adjacent Yard Boundary
- ▬ Former Iron King Mine Property
- ▬ Former Humboldt Smelter Property
- ▬ Dewey-Humboldt Town Boundary

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

- ▬ Former Humboldt Smelter Property
- ▬ Dewey-Humboldt Town Boundary

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

- - - Former Humboldt Smelter Property
- - - Dewey-Humboldt Town Boundary

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk. Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^bSample locations 09-A through 09-I not plotted because location coordinates are not available. Sample location names are color coded using the same color scheme as that used for sample points in the legend above.

Notes:

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

RSL = EPA Regional Screening Level.
Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.
Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).

^aPre-removal samples refer to samples collected from an area subsequently subject to removal action. The color shown for the sample reflects the concentration prior to soil removal.

^bSample locations 07-A through 07-I not plotted because location coordinates are not available. Sample location names are color coded using the same color scheme as that used for sample points in the legend above. Because coordinates are unavailable, these are all considered pre-removal samples for this yard (see Section 3.4 for details).

Notes:

RSL = EPA Regional Screening Level.

Surface soil samples have a beginning depth less than or equal to 2 feet below ground surface. At locations where multiple samples were collected at less than or equal to 2 feet below ground surface, the symbolized concentration represents the maximum result. Screening levels were used solely to evaluate the nature and extent of contamination; they are not intended to infer the existence of unacceptable risk.

Aerial imagery dated 2010 and provided by Lockheed Martin SERAS (2015).
