Dear Ms. Chase:

Weston Solutions, Inc. (WESTON®) is submitting the Final Trip Report for the Newark South Groundwater Plume Site (the Site). This Trip Report summarizes the field activities and analytical results of the sampling conducted at the Site from January 31, 2017 to September 27, 2017. If you have any questions regarding this report, please call me at (610) 701-3791.

Sincerely,

WESTON SOLUTIONS, INC.

1.0 INTRODUCTION

Under the Eastern Area Superfund Technical Assessment and Response Team (START) Contract No. EP-S3-15-02, Technical Direction Document (TDD) No. W501-16-10-003, the U.S. Environmental Protection Agency (EPA) Region III tasked Weston Solutions, Inc. (WESTON®) to install groundwater monitoring wells at the Newark South Groundwater Plume Site (the Site) located in Newark, New Castle County, Delaware. Following installation and development of the monitoring wells, groundwater samples were collected from each of the wells for analysis of volatile organic compounds (VOCs).

The objective of this sampling is to determine whether the presence of VOCs in groundwater, mainly tetrachloroethene (PCE) and trichloroethene (TCE), pose the potential for vapor intrusion to nearby residences and businesses. To achieve this objective, START collected groundwater samples from newly installed and existing groundwater monitoring wells. All groundwater monitoring well locations and sampling locations were identified by the On-Scene Coordinator (OSC) based upon field conditions and previous sampling results. The groundwater analytical results were compared to the Newark South Residential Groundwater Vapor Intrusion Screening levels (VISLs).

2.0 BACKGROUND

This section describes the site location, presents a description of the Site, and discusses the site history.

2.1 SITE LOCATION

The Site is located in Newark, New Castle County, Delaware, as shown on Figure 1. The Site is generally bound by Route 72 (South Chapel Street) to the east, I-95 to the south, Robscott Manor housing development to the west and Route 4 (Chestnut Hill Road) to the North, as depicted on Figure 2. The approximate geographic coordinates of the center of the Site are 39.65374° north latitude and -75.73538° west longitude.

2.2 SITE DESCRIPTION

The Site encompasses approximately 50 parcels covering roughly 164 acres (0.25 square miles). The Site is bisected north to south by the Conrail line and east to west by Bellevue Road. As shown on Figure 2, the Site is situated among housing developments, farmland, and commercial and industrial complexes. The Site comprises mixed use properties, including fabrication, retail, warehousing, research and development, production, commercial facilities and vacant land. The U.S. Geological Survey quarter quad indicates that the topography of the Site slopes in a southerly direction from 90 feet at Route 4 (Chestnut Hill Road) to 70 feet at I-95.

2.3 SITE HISTORY AND PREVIOUS INVESTIGATIONS

In 2002, Delaware Department of Natural Resources and Environmental Control (DNREC) completed a source water assessment of the City of Newark public supply wells. Analytical results of samples collected from the South Well Field public supply wells revealed that Public Supply Wells 11, 13, and 14 contained PCE. The concentration of PCE in Public Supply Well 11 were above the EPA Maximum Contaminant Level (MCL) of 5 micrograms per liter ($\mu\text{g}/\text{L}$). Public Supply Well 15 contained concentrations of 1,1,1-trichloroethane (TCA), TCE, and 1,1-dichloroethene (DCE); however, concentrations of these three VOCs were detected below their respective MCLs of 200 $\mu\text{g}/\text{L}$, 5 $\mu\text{g}/\text{L}$, and 70 $\mu\text{g}/\text{L}$, respectively (DNREC, 2002). Continued sampling of the wells has shown PCE contamination as high as 61 $\mu\text{g}/\text{L}$, 6.36 $\mu\text{g}/\text{L}$, 9.1 $\mu\text{g}/\text{L}$, 51.9 $\mu\text{g}/\text{L}$, 9.9 $\mu\text{g}/\text{L}$ in wells 10, 11, 13, 14, and 15, respectively (DNREC, 2015a). Since 2002, numerous environmental investigations have been conducted throughout the Site area by individual companies on their properties, including Dow Chemical (formerly Rohm & Hass and Rodel, Inc), DuPont, General Electric, PermaFlex Rollers, and Pencader Dry Cleaners. Analytical results of groundwater samples collected from installed wells on these properties confirm the presence of PCE in seven of the eight monitoring wells. TCE was detected in one. (DNREC, 2015a).

In 2004, the City of Newark installed a booster pump station and aeration system at the South Well Field for the removal of VOCs in groundwater (DNREC, 2015b). In 2010, DNREC completed a Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) Preliminary Assessment (PA) of the Site. Results of the PA identified numerous potential sources for

the VOCs in groundwater and determined further CERCLA action was warranted due to the contamination in the public supply wells (DNREC, 2010).

In 2015, DNREC conducted a CERCLA Site Inspection (SI) of the Site, which included the installation of monitoring wells and the collection of groundwater samples. The primary contaminant of concern (COC) in this investigation was PCE and related degradation products, TCE in particular. PCE was detected in seven of the eight monitoring wells and TCE was detected in one well. The highest exceedance of PCE was in Monitoring Well (MW) 10 at 42 parts per billion (ppb). The second highest exceedance was in MW16 at 22 ppb. MW16 also had the only detection of TCE at 4 ppb (DNREC, 2015a).

The State of Delaware has referred the Site to EPA for further consideration. EPA is considering the Site for potential inclusion on the National Priorities List (NPL).

3.0 SITE ACTIVITIES

From January 31 through February 15, 2017, and from September 25 through September 27, 2017, WESTON installed 9 groundwater monitoring wells and conducted two groundwater monitoring well sampling events as outlined in the Final Field Sampling Plan – Groundwater and Sub-slab Air Sampling for the Newark South Groundwater Plume Site (WESTON, 2017). There were no deviations from the Site sampling plan. WESTON documented site activities in accordance with WESTON Standard Operating Procedure (SOP) No. 101, Logbook Documentation (WESTON, 2015). This section discusses sampling activities conducted during this assessment.

3.1 GROUNDWATER MONITORING WELL INSTALLATION AND DEVELOPMENT

From January 31 through February 8, 2017, WESTON, along with its subcontractor, Eichelbergers Inc., installed a total of nine monitoring wells on the Site identified as MW-21, MW-22-Shallow, MW-22-Deep, MW-23, MW-24, MW-25, MW-26-Shallow, MW-26 Deep, and MW-27. Prior to conducting well installation activities, utility clearances were provided by the Delaware Miss Utility (One Call). Known utilities were marked with paint on the ground. Following the clearance of the nine new groundwater monitoring well locations, WESTON and Eichelbergers Inc. mobilized to the Site to

perform soil boring and well installation activities. Eichelbergers Inc. soft dug each well location down to 5 feet below ground surface (bgs) to ensure the clearance of underground utilities. Continuous Geoprobe® soil cores from each new well location were collected in dedicated, 5-foot-long acetate sleeves, logged for lithological characteristics, and screened for the presence of organic vapors using a calibrated photoionization detector (PID). Soil samples were collected by EPA and DNREC and were analyzed for VOC concentrations at DNREC's Environmental Laboratory. There were no elevated PID readings collected from the soil borings or significant detections of VOCs in any of the collected soil samples. Boring logs are included in Appendix A. The locations of the wells are provided on Figure 3, PCE Results.

WESTON conducted well installation activities in accordance with EPA Environmental Response Team (ERT) SOP No. 2050, Model 7822DT Geoprobe® Operation (EPA ERT, 2015). Groundwater was encountered between approximately 13 to 24 feet bgs. The majority of the monitoring wells were drilled and installed to a maximum depth of 30 feet bgs (target depth of 8 feet below water table) with a 10-foot screened interval inserted at the top of the water table (For example: water level – 12 feet bgs; total depth of well – 20 feet bgs; screened interval – 10 to 20 feet bgs). The screens were installed such that about 2 feet of screen is above the top of the water table and 8 feet below. Two wells were drilled and installed to a depth of approximately 50 feet bgs. The wells were constructed using a 1-inch inner diameter polyvinyl chloride (PVC) casing with a 10-foot screened interval consisting of 0.01-inch slotted PVC screen. The PVC screened intervals were sand packed using No. 1 grade silica sand to a depth of 1 to 2 feet above the top of the screen. A 3-foot-thick bentonite seal was placed above the sand pack. The surface completion consists of an 8-inch-diameter flush mounted well box. All monitoring wells have protective locking caps finished with 24-inch by 24-inch surface concrete pads.

Following well installation, the drilling subcontractor developed the wells to remove fine-grained sediments from the well screen. Developing the wells in this manner allows the water to flow freely from the formation into the well and reduces turbidity of the groundwater during sampling.

Following the completion of the new well installations, the horizontal coordinates and ground surface elevations of each temporary well were surveyed by Transition Engineering Surveying on April 3, 2017 so survey. The surveyed ground surface elevation at each well was referenced relative to an established vertical benchmark (North American Vertical Datum of 1988 [NAVD88]), in feet above mean sea level

(MSL). The horizontal coordinates of each well were referenced to the horizontal datum Delaware State Plane (North American Datum of 1983 [NAD83]). The survey data for all of the new monitoring wells are provided in Appendix C of this report.

Prior to commencing development activities, static water level measurements were collected by WESTON from all monitoring wells in accordance with WESTON SOP No. 204, Water Level Measurements (WESTON, 2011a). During development, water quality parameters, including pH, turbidity, specific conductance, dissolved oxygen, Eh/oxidation reduction potential, and temperature, will be periodically measured and monitored in accordance with WESTON SOP No. 210, Field pH, Conductivity, and Temperature Measurement (WESTON, 2011b) using a field calibrated YSI multi-parameter water quality meter. A minimum of three well volumes were removed from each well during development. The discharge water was relatively clear (sediment free), and general water quality parameters have stabilized as follows:

- | | |
|--------------------------|--------------------------|
| ▪ pH: | ±0.1 unit |
| ▪ Specific conductance: | ±3% |
| ▪ ORP (Eh): | ±10 millivolt (mV) |
| ▪ Dissolved Oxygen (DO): | ±10 percent (%) |
| ▪ Temperature | ±0.1 degree Celsius (°C) |

Parameter stabilization is generally defined as three consecutive readings collected 5 minutes apart. The turbidity of the groundwater was also measured and recorded during development. All well development and water level measurements were recorded by WESTON personnel in the site logbook or on data collection forms.

To reduce the potential for cross-contamination from well locations, the wells were installed in order from the least likely to be contaminated (the upgradient location) first, to the most likely to be contaminated last. Hollow stem augers were decontaminated between locations. All pumps and downhole tools were fully decontaminated between wells using tap water and a phosphate-free dilute Alconox® detergent solution followed by a clean water rinse. Wash water and soil cuttings were containerized into 55-gallon steel drums along with sampling purge water and soil cuttings and disposed of off-site on July 13, 2017.

3.2 GROUNDWATER MONITORING WELL SAMPLING

Six days following development of the wells, WESTON collected groundwater samples from the nine new monitoring wells and one pre-existing groundwater monitoring well identified by the OSC. A field duplicate sample was collected from one of the wells for quality assurance/quality control purposes. A second round of groundwater well samples was collected from September 25 through September 27, 2017. The second round of groundwater samples included the nine new monitoring wells in addition to 10 groundwater samples from pre-existing groundwater monitoring wells identified by the OSC.

Prior to purging and sampling activities, WESTON collected static water levels from the wells in accordance with WESTON SOP No. 204, Water Level Measurements (WESTON, 2011a). A Geotech Geopump was used to conduct low-flow groundwater sampling at each monitoring well in accordance with the groundwater sampling procedures outlined in Section 4.3.1 of the Field Sampling Plan for the Newark South Groundwater Plume Site (WESTON, 2017) and WESTON SOP No. 201, Groundwater Well Sampling (WESTON, 2011c). Water quality parameters, including pH, turbidity, specific conductance, dissolved oxygen (DO), oxygen reduction potential (ORP), and temperature, were measured during purging in accordance with WESTON SOP No. 210, Field pH, Conductivity, and Temperature Measurement (WESTON, 2011b) using a field calibrated YSI multi-parameter water quality meter with a flow-through cell or equivalent.

The wells were purged at a rate that did not exceed 1 liter per minute (L/min) (0.25 gallons per minute). Water quality parameters were measured and recorded at 5-minute intervals until at least three consecutive readings were stabilized as follow:

- pH: ±0.1 unit
- Specific conductance: ±3%
- ORP (Eh): ±10 millivolt (mV)
- DO: ±10 percent (%)
- Temperature ±0.1 degree Celsius (°C)

Once the wells stabilized, groundwater samples were collected from each well for VOC analysis. WESTON collected groundwater samples directly from the sample/purging tubing into three 40mL VOA vials preserved with hydrochloric acid. All well purge data and water level measurements were

recorded by WESTON personnel in the data collection forms. The Well Purge Data Forms are provided in Appendix D.

3.3 SAMPLE MANAGEMENT

All samples collected during the 2017 sampling events were handled and packaged in accordance with the *Contract Laboratory Program Guidance for Field Samplers* (EPA, 2014) and shipped to Contract Laboratory Program (CLP) laboratories for analysis of VOCs. Samples collected in February 2017 were shipped to Chemtech Consulting Group and submitted under Routine Analytical Services (RAS) Case Number 46807. Samples collected in September 2017 and shipped to Chemtech Consulting Group and submitted under RAS Case Number 47127. All shipping containers were properly labeled with EPA chain-of-custody seals and delivered with signed chain-of-custody forms and appropriate hazard warnings for laboratory personnel. Copies of the chain-of-custody records are provided with the Validated Laboratory Results Packages in Appendix E. As appropriate, samples were preserved and all samples were kept on ice during delivery to the assigned laboratories.

4.0 ANALYTICAL RESULTS

This section summarizes the analytical results for the samples collected at the Site by WESTON during this evaluation. All samples were analyzed under the EPA CLP in accordance with the EPA CLP Statement of Work (SOW) SOM02.4 for Trace VOCs (EPA, 2016). Validated laboratory results packages are provided in Appendix E.

4.1 GROUNDWATER RESULTS

The monitoring well groundwater analytical results were compared to the Newark South Residential Groundwater VISLs. VOCs detected in groundwater samples collected in February 2017 are summarized in Table 1, and VOCs detected in groundwater samples collected in September 2017 are summarized in Table 2. VOCs detected in groundwater samples collected from the DNREC and PPC monitoring wells are summarized in Table 3. The monitoring well locations located in the Scottfield and Brookside residential developments are depicted in Figure 3. The DNREC and PPC monitoring well locations are depicted in Figure 4.

No VOCs were detected at concentrations above the VISLs levels in any of the residential groundwater samples collected during the February 2017 sampling event.

Three VOCs were detected above VISL screening values in groundwater samples that were collected in September 2017. PCE was detected above the VISL of 5.8 µg/L at concentrations ranging from 10 µg/L to 48 µg/L in wells MW-06, MW-10, MW-16, and MW-18. TCE was detected above the VISL of 0.52 µg/L at concentrations of 0.72 µg/L and 3.6 µg/L in wells MW-18 and MW-16, respectively. Chloroform was detected above the VISL of 0.81 µg/L at concentrations ranging from 0.81 µg/L to 0.86 µg/L in wells MW-6, MW-14, MW-16, and MW-21.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Future actions will be contingent on the associated results and at the direction of EPA.
