## EXECUTIVE SUMMARY

Tetra Tech, Inc. (Tetra Tech) was tasked by the U.S. Environmental Protection Agency (EPA) under the Superfund Technical Assessment and Response Team (START) Contract (EP-S7-13-06) to conduct a Phase II Targeted Brownfields Assessment (TBA), Phase I TBA Update, and Analysis of Brownfields Cleanup Alternatives (ABCAs) at the Fashions R Boutique site (the site), an approximately 0.55-acre property at 9844 West Florissant Avenue in Dellwood, Missouri. Activities proceeded as specified in a site-specific Quality Assurance Project Plan (QAPP) for the Phase II TBA developed by START and submitted to EPA in February 2018 (Tetra Tech 2018).

In June 2017, Terracon Consultants, Inc. (Terracon) conducted a Phase I TBA of the site on behalf of the Missouri Department of Natural Resources (MDNR). The Phase I TBA identified a recognized environmental condition (REC) associated with historical use of the site as an auto service and machine shop (Terracon 2017). Also, the adjoining property to the north was listed in the Underground Storage Tank (UST) and Leaking Underground Storage Tank (LUST) databases. USTs had been removed from that property in the 2000s, and impacts on soil and groundwater had been detected at the northern portion of the property (north of the site). Additional investigations occurred, and a No Further Action Letter was issued in 2016; therefore, this was not considered a REC (Terracon 2017).

Purposes of this Phase II TBA were to determine (1) if historical activities at the subject property had impacted soils and groundwater, and (2) if historical activities at surrounding properties had impacted groundwater. During this investigation at the subject property, soil and groundwater samples were collected for laboratory analysis. All sampling results were compared to (1) Missouri Risk-Based Corrective Action (MRBCA) Lowest Default Target Levels (LDTL), and (2) MRBCA Tier 1 Risk-based Target Levels (RBTL) for non-residential land use, soil type 3, indoor inhalation of vapor emissions.

Findings and conclusions are as follows:

- All soil samples were found to contain at least one volatile organic compound (VOC) at a concentration above the laboratory reporting limit, and four soil samples contained VOCs at levels above LDTLs, including methylene chloride, naphthalene, and n-propylbenzene. No soil sample contained polycyclic aromatic hydrocarbons (PAH) above laboratory reporting limits. Six soil samples contained at least one “type” of total petroleum hydrocarbons (TPH) (“types” of TPH differentiated by range of number of carbons in the molecule) at a concentration above the laboratory reporting limit, and one sample contained TPH – gasoline-range organics (GRO) at a concentration above the LDTL. All soil samples contained arsenic, barium, chromium, and lead at levels above respective laboratory reporting limits. Additionally, in all soil samples, lead concentrations exceeded the LDTL, and in 13 soil samples, arsenic concentrations exceeded the LDTL; however, those concentrations were comparable to naturally occurring surface soil

concentrations within St. Louis County, Missouri (USGS 2018). In no soil sample did an analyte concentration exceed an RBTL.

- All groundwater samples contained at least one VOC at a concentration above the laboratory reporting limit, and three groundwater samples contained VOCs at concentrations above LDTLs, including n-propylbenzene, n-butylbenzene, benzene, and methylene chloride. Two groundwater samples contained at least one PAH at a concentration above the laboratory reporting limit, and one sample contained naphthalene at a concentration above the LDTL. Six groundwater samples contained at least one type of TPH at a concentration above the laboratory reporting limit, and two samples contained TPH concentrations above the LDTL, including TPH-GRO and TPH - diesel-range organics (DRO). All groundwater samples contained most Resource Conservation and Recovery Act (RCRA) total metals at concentrations above laboratory reporting limits, and all samples contained at least one RCRA metal at concentrations above LDTLs, including arsenic, barium, cadmium, lead, and chromium. In no groundwater sample did an analyte concentration exceed an RBTL.

Based on analytical results that include detections of analytes within the former building's footprint, a release of solvents, gasoline, and diesel may have occurred due to historical use of the site as an auto service and machine shop. However, follow-up action appears unwarranted to address soil and groundwater contamination that might preclude future non-residential recreational use of the property because (1) private water wells identified during the Phase I TBA are greater than one half mile north and upgradient from the subject property (Terracon 2017), therefore; groundwater will not be used as drinking water, and (2) no analyte concentration in soil and groundwater exceeded an RBTL.

## **1.0 INTRODUCTION**

Tetra Tech, Inc. (Tetra Tech) was tasked by the U.S. Environmental Protection Agency (EPA) under the Superfund Technical Assessment and Response Team (START) Contract (EP-S7-13-06) to conduct a Phase II Targeted Brownfields Assessment (TBA), Phase I TBA Update, and Analysis of Brownfields Cleanup Alternatives (ABCAs) at the Fashions R Boutique site (the site), an approximately 0.55-acre property at 9844 West Florissant Avenue in Dellwood, Missouri. The site currently hosts no structures and is a partially paved vacant lot. The foundation of a former building is still present at the site. Historical documentation and information indicate that the site hosted an auto parts store and machine shop from at least as early as 1986 to 2001. A building at the site that was later used as a clothing boutique burned in 2014 (Terracon Consultants, Inc. [Terracon] 2017). Intended future use of the site is recreational, including a community garden.

In June 2017, Terracon conducted a Phase I TBA of the site on behalf of the Missouri Department of Natural Resources (MDNR). The Phase I TBA identified a recognized environmental condition (REC) associated with historical use of the site as an auto service and machine shop (Terracon 2017). Also, the adjoining property to the north was listed in the Underground Storage Tank (UST) and Leaking Underground Storage Tank (LUST) databases. USTs had been removed from that property in the 2000s, and impacts on soil and groundwater had been detected at the northern portion of the property (north of the site). Additional investigations occurred, and a No Further Action Letter was issued in 2016; therefore, this was not considered a REC (Terracon 2017). The following sections address the background and site history, describe Phase II TBA activities, present and evaluate analytical results, discuss findings, and offer conclusions.

### **1.1 PURPOSES**

Purposes of this Phase II TBA included a determination on whether historical activities at the subject property and at adjacent properties had impacted soil and groundwater at the subject property. During this Phase II TBA, sampling of soil and groundwater occurred to confirm or eliminate the REC to the subject property (i.e., possible historical releases of contaminants) identified during a Phase I TBA of the subject property in June 2017.

### **1.2 SPECIAL TERMS AND CONDITIONS**

No special terms or conditions were identified during the Phase II TBA.

## **2.0 BACKGROUND AND SITE HISTORY**

This section briefly describes the site (physical setting, site location and land use, and adjacent land use), and summarizes previous assessments.

### **2.1 PHYSICAL SETTING**

The Fishpot - Urban Land Complex (Fishpot series) is the most prevalent soil association in the area. Urban land is characterized by extensive development where at least 80 percent (%) of the surface is covered by pavement or structures, and where the underlying soil type has been rendered unidentifiable (Terracon 2017). The Fishpot series consists of very deep, somewhat poorly drained soils formed in silty and loamy material that has been disturbed to depth exceeding 30 inches over alluvial or terrace soils. Non-soil material (such as cinders, broken bricks, broken concrete) is mixed with the disturbed soil in most places. The buried soil is variable in color, and typically is silty loam or silty clay loam. Slopes range from 0 to 5%. The typical soil profile consists of stratified silty loam to a depth of 60 inches below ground surface (bgs) (U.S. Department of Agriculture [USDA] 1999).

Uppermost bedrock in the area includes the Marmaton Group, which consists of cyclic deposits of shale and limestone with some sandstone and clay. This group also contains several workable coal beds. Beneath the Marmaton Group lies the Cherokee Group, which consists of cyclic deposits of shale, sandstone, clay, and several workable coal beds (United States Geological Survey [USGS] 2017).

The site is within the northern portion of the Ozark Plateaus Aquifer system, which consists of three main aquifers. From shallowest to deepest, the three aquifers are the Springfield Plateau aquifer, which consists almost entirely of Mississippian-age limestone; the Ozark aquifer, which mostly consists of Devonian- to Cambrian-age limestone and high-yielding dolomite; and the St. Francois aquifer, which mostly consists of Cambrian-age dolomite and sandstone (USGS 1997). A tributary of Maline Creek is approximately 450 feet south of the site.

In the Phase I TBA prepared by Terracon, EDR extracted no data on groundwater flow and velocity. In the absence of site-specific data or other indicators, direction of groundwater flow may be inferred from the regional topographic gradient. Therefore, groundwater flow is inferred to the south in the direction of the topographic gradient (Terracon 2017).

There are three wells located within a one-mile radius of the site. Two of the wells are private water wells and one is a USGS Water Science well. However, all three wells are located greater than one half mile north and upgradient of the site (Terracon 2017).

## **2.2 SITE DESCRIPTION AND FEATURES**

The site is at 9844 West Florissant Avenue in Dellwood, Missouri. The site is depicted on the Clayton, Missouri, USGS 7.5-minute topographic series map (USGS 1975) and is just south of the Florissant, Missouri, USGS 7.5-minute topographic series map (USGS 1982) (see Appendix A, Figure 1). Coordinates at the approximate center of the site are 38.7468600 degrees north latitude and 90.2790240 degrees west longitude. The approximately 0.55-acre site currently hosts no structures and is a partially paved vacant lot. The foundation of a former building is still present at the site. Figure 2 in Appendix A illustrates the approximate footprint of the former building and the site boundaries.

## **2.3 SITE HISTORY AND LAND USE**

The site currently hosts no structures and is a partially paved vacant lot. The foundation of a former building is still present at the site. Historical documentation and information indicate that the site hosted an auto parts store and machine shop from at least as early as 1986 to 2001. A building at the site that was later used as a clothing boutique burned in 2014 during civil unrest (Terracon 2017). Intended future use of the site is recreational, including a community garden.

## **2.4 ADJACENT PROPERTY USE**

The subject property is bounded on the north by Auto Spa Speedy Wash, a car wash; east by residential housing; south by a vacant lot; and west by West Florissant Avenue, with commercial and retail buildings beyond.

## **2.5 SUMMARY OF PREVIOUS ASSESSMENTS**

This section summarizes a Phase I TBA, the only known previous environmental investigation at the subject property. In June 2017, Terracon conducted the Phase I TBA of the site on behalf of MDNR. Historical documentation in the Phase I TBA report indicates that the subject property was identified as Dellwood Automotive in the Historical Auto Service database from approximately 1986 to 1989. The facility was listed as a gasoline service station and motor vehicle supplies and parts store, although a building at the site was subsequently used as a clothing boutique (it burned in 2014 during civil unrest) (Terracon 2017). The Phase I TBA identified a REC associated with historical use of the site as an auto service and machine shop (Terracon 2017). However, the property was not listed as a Resource Conservation and Recovery Act (RCRA) hazardous waste generator, and no registered USTs, spills, or releases were indicated at the property.

The adjoining property to the north was listed in the UST and LUST databases. USTs had been removed from that property in the 2000s, and impacts on soil and groundwater had been detected at the northern portion of the property (north of the site). Additional investigations occurred, and a No Further Action Letter was issued in 2016; therefore, this was not considered a REC (Terracon 2017).

### **3.0 PHASE II TARGETED BROWNFIELDS ASSESSMENT ACTIVITIES**

The following sections describe the scope of the Phase II TBA, field exploration and methods, and associated quality assurance (QA)/quality control (QC) activities. START members April Halley, Dave Kinroth, and Tetra Tech subcontractor, Plains Environmental Services, Inc. (PES), performed sampling from April 11 through 12, 2018. Photographic documentation is in Appendix B. A copy of the site logbook with documented site activities is in Appendix C. Soil and groundwater samples were collected to identify contamination possibly present at the subject property. An objective was to characterize possible historical releases to the environment. Activities proceeded as specified in a site-specific Quality Assurance Project Plan (QAPP) for the Phase II TBA developed by START and submitted to EPA in February 2018 (Tetra Tech 2018).

#### **3.1 SUBSURFACE SOIL SAMPLING**

PES advanced eight direct-push technology (DPT) soil borings to groundwater, or to geologic refusal, whichever occurred first (approximately 20 to 29 feet bgs). Three borings were along the northern edge of the property, three borings were within the former building footprint, one boring was along the eastern edge of the property, and one boring was at the southwest corner of the property (see Appendix A, Figure 2). Continuous soil borings were collected at 5-foot depth intervals and screened by use of a photoionization detector (PID). PID readings and soil classifications such as color, type, and moisture content were documented in boring logs (see Appendix D). At each boring location, two soil samples were collected and submitted for laboratory analysis. Soil samples were collected within depth intervals inducing the highest PID readings. If no elevated readings were observed, collection occurred within intervals where visual impacts appeared or odors were detected. If no indications of contamination were found, the soil samples were collected within depth intervals selected by the START field team, including intervals within the capillary fringe (if groundwater was encountered) or within the bottom portion of the boring (if refusal was encountered). A duplicate sample was collected at boring location SB-4 (18-20 feet bgs) to be used as a QA/QC measure of total method precision.

At each sampling interval, a grab sample for analysis for volatile organic compounds (VOC) and total petroleum hydrocarbons (TPH) – gasoline range organics (GRO) was collected in accordance with EPA SW-846 Method 5035; approximately 5-gram plugs of soil (one plug per sample container) were collected by use of a disposable, tipless, plastic syringe, and transferred to two 40-milliliter (mL) vials preserved with sodium bisulfate, and one 40-mL vial preserved with methanol. Remaining soil was placed into two 8-ounce jars for analysis for TPH – diesel range organics (DRO), TPH – oil range

organics (ORO), polynuclear aromatic hydrocarbons (PAH), RCRA total metals (excluding mercury), and percent solids. Table 1 below lists soil sample information, including sample depths, coordinates, and collection dates and times.

### **3.2 GROUNDWATER SAMPLING**

In the Phase I TBA prepared by Terracon, EDR extracted no data on groundwater flow and velocity. In the absence of site-specific data or other indicators, direction of groundwater flow may be inferred from the regional topographic gradient. Therefore, groundwater flow is inferred to the south in the direction of the topographic gradient (Terracon 2017).

Groundwater samples were collected at six of the eight boring locations (see Appendix A, Figure 2). No groundwater sample was collected at SB-6 or SB-8. Groundwater was encountered at SB-6, and a temporary well was installed; however, no groundwater could be recovered. No groundwater was collected at SB-8 due to geologic refusal.

Groundwater samples were collected by use of a Geoprobe® Screen Point 16 sampling apparatus. At each location, the sampler was advanced to approximately 4-5 feet below the water table, and then the screen was exposed to the aquifer. After the screen was deployed at the bottom of the boring, about 1 gallon of water was purged through disposable polyethylene tubing, utilizing a check valve placed at the bottom of the tubing.

Samples for analysis for VOCs and TPH-GRO via SW-846 Method 8260 were collected into three 40-mL vials preserved with hydrochloric acid (HCl). Samples for analysis for TPH-DRO, TPH-ORO and PAHs via SW-846 Method 8270 were collected in two unpreserved 1-liter (L) amber glass bottles. Samples for total RCRA total metals analysis via SW-846 Method 6020 were collected in 1-L plastic bottles preserved with nitric acid (one container per sample).

Each sample was labeled and packaged accordingly, and placed in a cooler maintained at or below a temperature of 4 degrees Celsius ( $^{\circ}\text{C}$ ) from time of collection until submittal for laboratory analyses. After completion of sampling, soil cores were placed back in their respective boreholes, which were then plugged with bentonite. A duplicate sample was collected at boring location SB-7 (GW7-FD) to be used as a QA/QC measure of total method precision. To evaluate effectiveness of decontamination procedures for the Geoprobe sampling equipment, an equipment rinsate blank sample was collected. To assess field- or laboratory-introduced contamination, a field blank sample was collected. Table 2 below summarizes groundwater and aqueous QC samples collected during this Phase II TBA.

On April 12, 2018, 17 soil samples (including one field duplicate), seven groundwater samples (including one field duplicate), one equipment rinsate blank, and one field blank were submitted via FedEx to the Test America laboratory in Nashville, Tennessee, for arrival on April 13, 2018.

### 3.3 DEVIATIONS FROM THE QAPP

The approved QAPP specified collection of groundwater samples in addition to soil samples at each boring location. However, no groundwater samples were collected at SB-6 or SB-8. Groundwater was encountered at SB-6, and a temporary well was installed; however, no groundwater could be recovered. No groundwater was collected at SB-8 due to geologic refusal. This deviation is not expected to adversely affect results of the investigation.

## **4.0 PRESENTATION AND EVALUATION OF RESULTS**

Section 4.0 discusses analytical results from samples collected during Phase II activities in April 2018. A copy of the analytical report provided by Test America, the associated chain-of-custody record, and a data validation report prepared by START are in Appendix E.

### **4.1 SOIL SAMPLES**

In Appendix F, Table F-1 summarizes laboratory results from soil samples analyzed for this investigation, and compares the data to MDNR Risk-Based Corrective Action (MRBCA) Lowest Default Target Levels (LDTL), and MRBCA Tier 1 non-residential land use, soil type 3, Risk-based Target Levels for indoor inhalation of vapor emissions (RBTL). All soil samples contained at least one VOC at a concentration above the laboratory reporting limit, and four of the 17 samples contained at least one VOC at a concentration above the LDTL. These four samples included SB-4 (18-20)-FD, SB-5 (16-18), SB-6 (6-8), and SB-8 (11-13)—all containing methylene chloride at concentrations above the LDTL; moreover, sample SB-5 (16-18) also contained naphthalene and n-propylbenzene at concentrations above LDTLs. No soil sample contained a PAH at a concentration above a laboratory reporting limit.

Six of the 17 soil samples contained TPH levels above the laboratory reporting limit, and one sample—SB-5 (16-18)—contained TPH-GRO at a concentration above the LDTL.

All soil samples contained concentrations of arsenic, barium, chromium, and lead above laboratory reporting limits. Additionally, all results for lead exceeded the LDTL, and 13 of the 17 sample results for arsenic exceeded the LDTL; however, those concentrations were comparable to naturally occurring surface soil concentrations within St. Louis County, Missouri. Arsenic concentrations in the subject property soil samples ranged from 1.46 to 13.1 milligrams per kilogram (mg/kg); the LDTL for arsenic is 3.89 mg/kg, and USGS reports typical arsenic concentrations in St. Louis County soils range from 4.091 to 17.435 mg/kg, with a mean of 10.561 mg/kg. Lead concentrations in the subject property soil samples ranged from 7.11 to 26.9 mg/kg; the LDTL for lead is 3.74 mg/kg, and USGS reports typical lead concentrations in St. Louis County soils range from 15.241 to 118.770 mg/kg, with a mean of 40.950 mg/kg (USGS 2018). No other metal was detected at concentration exceeding an LDTL.

No soil sample analyte concentration exceeded an RBTL. A full analytical report of all soil sample results is in Appendix E.

## **4.2 GROUNDWATER SAMPLES**

In Appendix F, Table F-2 summarizes laboratory results for groundwater samples analyzed for this investigation, and compares the data to MRBCA LDTLs and RBTLs. All groundwater samples contained at least one VOC at a concentration above the laboratory reporting limit, and three of the seven groundwater samples contained at least one VOC at a concentration above the LDTL. These three samples included SB-1 (GW1) with n-propylbenzene and n-butylbenzene above LDTLs; SB-3 (GW3) with benzene, n-propylbenzene, and n-butylbenzene above LDTLs; and SB-5 (GW5) with methylene chloride, n-propylbenzene, and n-butylbenzene above LDTLs.

Two of the seven groundwater samples contained at least one PAH at a concentration above the laboratory reporting limit. One sample contained at least one PAH at a concentration above the LDTL—SB-3 (GW3) with a naphthalene concentration above the LDTL.

Six of the seven groundwater samples contained TPH at concentrations above the laboratory reporting limit, and two of the samples contained TPH at concentrations above the LDTL. These two samples included SB-3 (GW3) with TPH-GRO and TPH-DRO above the LDTL, and SB-5 (GW5) with TPH-DRO above the LDTL.

All groundwater samples contained most RCRA total metals at concentrations above laboratory reporting limits, and all samples contained at least one RCRA metal at a concentration above the LDTL. These samples included SB-1 (GW1) with arsenic above the LDTL; SB-(GW2) with arsenic and cadmium above the LDTL; SB-3 (GW3) with arsenic, barium, and lead above the LDTL; SB-4 (GW4) with arsenic, barium, cadmium, chromium, and lead above the LDTL; SB-5 (GW5) with arsenic, cadmium, and lead above the LDTL; and SB-7 (GW7) and SB-7(GW7-FD) with arsenic, barium, cadmium, and lead above the LDTL.

In no groundwater sample did an analyte concentration exceed an RBTL. A full analytical report is in Appendix E.

#### **4.3      QUALITY CONTROL SAMPLES**

Results from soil and groundwater duplicate samples listed in Appendix F, Tables F-1 and F-2, indicated no major variances in method precision. Acetone, TPH-DRO, TPH-ORO, and barium were detected in the equipment rinsate blank and field blank at concentrations greater than method detection limits but less than laboratory reporting limits. Chromium was detected in both blanks at concentrations above the laboratory reporting limit, at 4.01 micrograms per liter ( $\mu\text{g}/\text{L}$ ) in the equipment rinsate blank and 2.31  $\mu\text{g}/\text{L}$  in the field blank. Chromium results from both blanks were well below the LDTL of 100  $\mu\text{g}/\text{L}$ .

## **5.0 DISCUSSION OF FINDINGS AND CONCLUSIONS**

In April 2018, START conducted a Phase II TBA at the subject property after a Phase I TBA by Terracon in June 2017 had identified a REC to the subject property due to historical use of the site as an auto service and machine shop. The Phase II TBA included collection of subsurface soil samples from DPT borings and groundwater samples from temporary wells.

START members April Halley and Dave Kinroth completed Phase II TBA sampling activities during April 11 and 12, 2018. Eight soil borings were advanced by Tetra Tech subcontractor, Plains Environmental Services, Inc. Soil borings were screened by use of a PID, and two soil samples were collected from each boring based on screening results and judgment of field personnel. Groundwater samples were collected at six of the eight boring locations. Samples were submitted to Test America via FedEx (on April 12, 2018), and analyzed for VOCs, TPH-GRO, TPH-DRO, TPH-ORO, PAHs, and RCRA total metals (excluding mercury).

All samples contained at least one VOC at a concentration above the laboratory reporting limit, and four soil samples contained VOCs at concentrations above the LDTL, including methylene chloride, naphthalene, and n-propylbenzene. No soil sample contained a PAH at a concentration above a laboratory reporting limit. Six soil samples contained at least one “type” of TPH (“types” of TPH differentiated by range of number of carbons in the molecule) at a concentration above a laboratory reporting limit, and one sample contained TPH-GRO at concentration above the LDTL. All soil samples contained arsenic, barium, chromium, and lead at levels above laboratory reporting limits. Additionally, all soil sample results exceeded the LDTL for lead, and 13 soil sample results exceeded the LDTL for arsenic; however, those concentrations were comparable to naturally occurring surface soil concentrations within St. Louis County, Missouri.

All groundwater samples contained at least one VOC at a concentration above a laboratory reporting limit, and three of the groundwater samples contained VOCs at concentrations above LDTLs, including n-propylbenzene, n-butylbenzene, benzene, and methylene chloride. Two groundwater samples contained at least one PAH at a concentration above a laboratory reporting limit, and one sample contained naphthalene at a concentration above the LDTL. Six groundwater samples contained at least one type of TPH at a concentration above laboratory reporting limit, and two of the samples contained at least one type of TPH at a concentration above LDTL, including TPH-GRO and TPH-DRO. All groundwater samples contained most RCRA total metals at concentrations above laboratory reporting limits, and all

samples contained at least one RCRA metal at concentration above an LDTL, including arsenic, barium, cadmium, lead, and chromium.

In no soil or groundwater sample did an analyte concentration exceed a MRBCA Tier 1 Risk-based Target Level (RBTL) for non-residential land use, soil type 3, indoor inhalation of vapor emissions.

Based on analytical results that indicate detections of analytes within the former building's footprint, a release of solvents, gasoline, and diesel may have occurred due to historical use of the site as an auto service and machine shop. However, follow-up action appears unwarranted to address soil and groundwater contamination that would preclude future non-residential recreational use of the property because (1) private water wells identified during the Phase I TBA are greater than one half mile north and upgradient from the subject property (Terracon 2017), therefore; groundwater will not be used as drinking water, and (2) no analyte concentration in soil and groundwater samples exceeded an RBTL.

#### Narrative

#### Job Narrative 490-150020-1

#### Comments

No additional comments.

#### Receipt

The samples were received on 4/13/2018 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 3.1° C, 3.8° C, 4.2° C, 4.3° C and 5.8° C.

#### GC/MS VOA

Method(s) 8260B: The following sample(s) were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory, and corrective action was not possible: GW1 (490-150020-1), GW3 (490-150020-3), GW4 (490-150020-4) and GW5 (490-150020-5).

Method(s) 8260B: The following volatile samples were analyzed with significant headspace in the sample container(s): GW4 (490-150020-4) and GW5 (490-150020-5). Significant headspace is defined as a bubble greater than 6 mm in diameter.

Method(s) 8260B: The container used for reanalysis of the following samples contained headspace: GW1 (490-150020-1) and GW5 (490-150020-5)

Method(s) 8260B: The method blank for analytical batch 490-510282 contained m-Xylene & p-Xylene above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction or re-analysis of samples was not performed.

Method(s) 8260B: The method blank for analytical batch 490-510390 contained Naphthalene above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction and re-analysis of samples was not performed.

Method(s) 8260B: The method blank for 490-510907 contained 1,2,4-Trimethylbenzene above the reporting limit (RL). None of the samples associated with this method blank contained the target compound. This analyte was not reported.

Method(s) 8260B: The method blank for analytical batch 490-510907 contained m-Xylene & p-Xylene and Naphthalene above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL). This analyte was not reported.

Method(s) 8260B: Due to sample matrix effect on the internal standard (ISTD), a dilution was required for the following sample: SB5 (16-18) (490-150020-20).

Method(s) 8260B: The laboratory control sample (LCS) for analytical batch 490-510907 recovered outside control limits for the following analytes: 2-Chlorotoluene. This analyte was not reported.

Method(s) 8260B: Surrogate recovery for the following samples was outside control limits: GW3 (490-150020-3), GW5 (490-150020-5) and SB1 (12.5-14.5) (490-150020-10), SB6 (6-8) (490-150020-21) and SB7 (11-13) (490-150020-23). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8260B: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for batch analytical batch 490-510390 recovered outside control limits for the following analytes: Methyl tert-butyl ether.

Method(s) 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 490-510576, 490-510617, and 490-510643.

Method(s) 8260B: Batch 490-510907 is reported without a matrix spike/matrix spike duplicate (MS/MSD). The batch MS/MSD was originally performed on another client's sample, and this test was canceled at client request. This MS/MSD result does not have immediate bearing on any samples except for the actual sample spiked. The associated laboratory control sample (LCS) met acceptance criteria and provides long-term precision and accuracy for this batch.

Method(s) 8270C: The following sample was diluted due to the nature of the sample matrix: GW3 (490-150020-3). Elevated reporting limits (RLs) are provided.

Method(s) 8270C: Surrogate recovery for the following sample was outside control limits: GW5 (490-150020-5). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8270C: The method blank for preparation batch 490-508958 and analytical batch 490-509306 contained Diesel Range Organics C10-C21 above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction and re-analysis of samples was not performed.

Method(s) 8270C: The method blank for preparation batch 490-508376 and analytical batch 490-509598 contained Diesel Range Organics C10-C21 and Oil Range Organics C21-C35 above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method(s) 8270C: The following sample was diluted due to the physical nature of the sample matrix: SB3 (5-7) (490-150020-14). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Metals

Method(s) 6020A: The method blank for preparation batch 490-509092 and analytical batch 490-509821 contained Barium and Chromium above the method detection limit (MDL). Associated samples were not re-analyzed because results were less than the reporting limit (RL).

Method(s) 6020A: The method blank for preparation batch 490-509820 and analytical batch 490-510598 contained Barium and Selenium above the method detection limit (MDL). Associated samples were not re-analyzed because results were less than the reporting limit (RL).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Qualifiers

### GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits
B	Compound was found in the blank and sample.
*	ISTD response or retention time outside acceptable limits
F2	MS/MSD RPD exceeds control limits
*	LCS or LCSD is outside acceptance limits.
*	RPD of the LCS and LCSD exceeds the control limits

### GC/MS Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.
X	Surrogate is outside control limits

### Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F2	MS/MSD RPD exceeds control limits
F1	MS and/or MSD Recovery is outside acceptance limits.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F4	MS/MSD RPD exceeds control limits due to sample size difference.

## Glossary

### Abbreviation

These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

GW7, GW7-FD, Equipment Blank, and Field Blank  
Matrix / Number of Samples: Sixteen Soil Samples, Five Water Samples, Two Field Duplicates  
and Two Blank Samples

The data were qualified according to the U.S. Environmental Protection Agency (EPA) Region 7 documents entitled "Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", dated January 2017, and "Contract Laboratory Program National Functional Guidelines for Superfund Inorganic Methods Data Review", also dated January 2017. In addition, the Tetra Tech document "Review of Data Packages from Subcontracted Laboratories" (February 2002) was used along with other criteria specified in the applicable methods.

The review was intended to identify problems and quality control (QC) deficiencies that were readily apparent from the summary data package. The following sections discuss any problems or deficiencies that were found, and data qualifications applied because of non-compliant QC. The data review was limited to the available field and laboratory QC information submitted with the project-specific data package.

I, Harry Ellis, certify that all data validation criteria outlined in the above-referenced documents were assessed, and any qualifications made to the data accorded with those documents.

## **DATA VALIDATION QUALIFIERS**

- U** — The analyte was not detected above the reported sample quantitation limit.
- J** — The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ** — The analyte was not detected above the reported sample quantitation limit, which is estimated.
- R** — The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria. Presence or absence of the analyte cannot be verified.

## **DATA ASSESSMENT**

Sample delivery group (SDG) J150020 included sixteen (16) environmental soil samples, five (5) environmental groundwater samples, and four (4) quality control (QC) samples (one soil field duplicate, one groundwater field duplicate, one equipment blank and one field blank). Samples were analyzed for volatile organic compounds (VOC) by EPA SW-846 Method 8260B, polynuclear aromatic hydrocarbons (PAH) by EPA SW-846 Method 8270C, total petroleum hydrocarbons (TPH) as gasoline range organics (GRO), diesel range organics (DRO, and oil range organics (ORO) by EPA SW-846 Methods 8260B and 8270C, and metals by EPA SW-846 Method 6020A. The following summarizes the data validation that was performed.

### **VOLATILE ORGANIC COMPOUND ANALYSES**

#### I. Holding Time and Chain of Custody (COC) Requirements

The samples were received by the laboratory and analyzed within the established holding time of 14 days from sample collection to analysis. No data were qualified. However, several vials were received with significant headspace, which may result in loss of analyte. These included the vials used for the undiluted analyses of samples GW4 and GW5 and those used for the diluted analyses of samples GW1 and GW5. The results for these analyses were qualified as estimated, possibly biased low, and flagged "J" or "UJ", as appropriate.

#### II. Matrix Spike/Matrix Spike Duplicate (MS/MSD)

Due to insufficient sample volume, no MS/MSD analyses were performed on these samples. The MS/MSD analyses performed on samples from other sites were not evaluated.

#### III. Blanks

Most laboratory (method) blanks yielded no detectable concentrations of analytes, but a few yielded low concentrations of one or two aromatic compounds (such as naphthalene and m+p-xylanes). The similar concentrations found in a few samples were qualified as laboratory artifacts and flagged "U".

In addition, the equipment and field blanks yielded low concentrations of the common laboratory contaminant acetone. Reported groundwater and soil concentrations of acetone were qualified as handling artifacts. Results below the sample reporting limits (RL) were qualified as nondetected and flagged zero, while those above the RL were qualified as estimated, possibly biased high, and flagged "J".

#### IV. Laboratory Control Sample (LCS)

All percent recoveries from the LCS analyses were within established control limits. No qualifications were applied.

#### V. Surrogates

Most surrogate recoveries were within their QC limits. In a few soil samples, one or two (of four) surrogates yielded a slightly high recovery in one analysis, but not in a re-analysis. No qualifications were applied for these minor irregularities.

## VI. Comments

Some detected concentrations were less than their reporting limits ("RL"). These low-concentration results were qualified as estimated (flagged "J"). In addition, several samples yielded one or more analytes at concentrations above their calibration range. TestAmerica reanalyzed these at appropriate dilutions to bring the results within calibration range, so no further qualifications were applied.

Field duplicate results were reasonably similar. No qualifications were applied.

## VII. Overall Assessment of Data

Overall data quality is acceptable, with no major qualifications applied. All data are usable as qualified for their intended purposes.

# **POLYNUCLEAR AROMATIC HYDROCARBON ANALYSES**

## I. Holding Time and Chain of Custody (COC) Requirements

The samples were received by the laboratory and analyzed within the established holding time of 14 days from sample collection to extraction and 40 days to analysis. No data were qualified.

## II. Matrix Spike/Matrix Spike Duplicate (MS/MSD)

Due to insufficient sample volume, no aqueous MS/MSD analyses were performed. No qualifications were applied for this data gap. All results from the soil MS/MSD analyses were within limits, so no qualifications were applied.

## III. Blanks

The laboratory (method) blank yielded no detectable PAH, so no qualifications were applied.

## IV. Laboratory Control Sample (LCS)

All percent recoveries from the LCS analyses were within established control limits. No qualifications were applied.

## V. Surrogates

Almost all surrogate recoveries were within QC limits. The exception was one (of three) surrogates in sample GW5. No qualifications were applied.

## VI. Comments

Some detected concentrations were less than their RLs. These low-concentration results were qualified as estimated (flagged "J"). Due to matrix interference, sample GW5 and some soil samples were analyzed at 2- of 5-fold dilutions. No qualifications were applied, but the nondetected results from these samples are not comparable to those of other samples. And a few samples were reanalyzed at dilutions for specific analytes, to bring them within calibration range. Again, no qualifications were applied.

Field duplicate results were quite similar.

## VII. Overall Assessment of Data

Overall data quality is acceptable, with no significant applied. All data are usable as reported for their intended purposes.

### **TOTAL PETROLEUM HYDROCARBON ANALYSES**

#### I. Holding Time and Chain of Custody (COC) Requirements

The samples were received by the laboratory and analyzed within the established holding times. No data were qualified.

#### II. Matrix Spike/Matrix Spike Duplicate (MS/MSD)

All MS/MSD results were within limits. No qualifications were applied.

#### III. Blanks

The laboratory (method) blanks yielded low concentrations of DRO and ORO. Field sample results less than their reporting limits were qualified as laboratory artifacts and flagged "U". Higher concentration results were not qualified.

#### IV. Laboratory Control Sample (LCS)

All percent recoveries from the LCS analyses were within established control limits. No qualifications were applied.

#### V. Surrogates

Almost all surrogate recoveries were within QC limits. The exception was one (of three) surrogates in sample GW5. No qualifications were applied.

#### VI. Comments

Some detected concentrations were less than their RLs. These low-concentration results were qualified as estimated (flagged "J"). Due to matrix interference, sample GW5 and some soil samples were analyzed at 2- of 5-fold dilutions. No qualifications were applied, but the nondetected results from these samples are not comparable to those of other samples. And a few samples were reanalyzed at dilutions for DRO to bring it within calibration range. Again, no qualifications were applied.

Field duplicate results were quite similar.

## VII. Overall Assessment of Data

Overall data quality is acceptable, with few qualifications applied. All data are usable as qualified for their intended purposes.

## METALS ANALYSES

### I. Holding Time and Chain of Custody (COC) Requirements

The samples were received by the laboratory and analyzed within the established holding time of 6 months from sample collection to analysis. No data were qualified.

### II. Matrix Spike/Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses performed on samples from other sites were not evaluated. In the MS/MSD analyses performed on sample SB5 (16-18), recoveries of barium could not be determined because the unspiked sample concentration was much higher than the spike. No qualifications were applied for this data gap. Chromium recoveries were 73 and 83 percent, versus the QC limits of 75 to 125 percent. Since the average recovery was acceptable, no qualifications were applied. Selenium recoveries were acceptable, but the RPD was 23 percent, just above the limit of 20 percent. Selenium was not detected in the unspiked sample, so no qualifications were applied.

### III. Blanks

Some laboratory blanks yielded low concentrations of barium, chromium, and/or selenium. Field sample results less than their reporting limit were qualified as laboratory artifacts and flagged "U". Higher concentrations were not qualified. After applying these qualifications, the equipment and field blanks had chromium concentrations somewhat above their reporting limits. Soil and groundwater chromium concentrations were much higher, so they were not qualified.

### IV. Laboratory Control Sample (LCS)

All percent recoveries from the LCS analyses were within established control limits. No qualifications were applied.

### V. Comments

Some detected concentrations (including all for silver) were less than their RLs. These low-concentration results were qualified as estimated (flagged "J").

The soil field duplicate results were quite similar, but sample GW7-DP yielded considerably higher concentrations of chromium, lead, arsenic, and selenium than sample GW7. This is probably due to different amounts of suspended solids in the two portions of the sample. Therefore the detected results for chromium, lead, arsenic, and selenium in both portions of that sample were qualified as estimated and flagged "J".

### VI. Overall Assessment of Data

Overall data quality is acceptable, with no major qualifications applied. All data are usable as qualified for their intended purposes.

## PART II- ENVIRONMENTAL ACTIVITIES (continued)

### ANECDOTAL PROPERTY INFORMATION (as available for all cooperative agreement types)

#### 26. Property Highlights:

The approximately 0.55-acre site currently hosts no structures and is a partially paved vacant lot. The foundation of a former building is still apparent at the site. Potential plans are for commercial redevelopment or a community garden. In June 2017, Terracon conducted a Phase I Environmental Site Assessment TBA of the site on behalf of the Missouri Department of Natural Resources (MDNR). The Phase I TBA identified a REC associated with historical use of the site as an auto service and machine shop. During the Phase II TBA, soil and groundwater sampling results detected VOCs, PAHs, TPH and RCRA metals above MDNR Default Target Levels, likely due to historic use of the site as an auto service and machine shop.
