## MEMORANDUM

**DATE:** 4 October 2006

**TO:** Ben Castellana, Ph.D., Weston Solutions, Sherman Oaks

**FROM:** Paul Swift, Ph.D., Weston Solutions, Seattle *PS, JR*

**SUBJECT:** Review and Validation – Metals by X-Ray Fluorescence Spectrometry  
*Field Laboratory Groups:* 062206, 062306, 062406, 062506, 062606,  
062706, 062806, and 062906  
*Site:* Halaco Engineering Company, Oxnard, California  
*Project:* Integrated Assessment

**CONTRACT:** GSA W91238-05-F-0052

**WORK ORDER:** 12767.062.317.5000

**cc:** Weston Solutions project file

The quality assurance review and validation of analytical results from 387 solid samples (soils and sediments), laboratory groups **062206, 062306, 062406, 062506, 062606, 062706, 062806,,** and **062906**, collected from the Halaco Engineering Company site, 6200 Perkins Road, Oxnard, Ventura County, California between 26 June and 29 June, 2006 has been completed.

The solid samples were analyzed for the range of metals detectable using Niton Cd-109 and Am-241 x-ray fluorescence (XRF) excitation sources. Of these, only results for selected CLP Target Analyte List (TAL) metals (antimony, arsenic, barium, cadmium, chromium, cobalt, copper, iron, lead, manganese, nickel, selenium, silver, tin, vanadium, and zinc) and molybdenum were reviewed and validated based on comparability with fixed-laboratory results generated for the project.

Samples were analyzed on-site by Weston Solutions, Inc., in an abandoned office space that was configured as a close-support laboratory. Samples were prepared and analyzed following EPA SW846 Method 6200, field-portable x-ray fluorescence spectrometry (FPXRP; also XRF), using a Niton XLp 733 equipped with Niton Cd-109 and Am-241 excitation sources.

EDD Summary Reports, listing the sample ID and method information for all laboratory groups for this review are included as an attachment.

## **Data Review, Verification, Validation, and Qualification**

The following comments refer to the laboratory performance in meeting the quality control criteria described in the individual analytical methods. The review follows the format described in the *National Functional Guidelines for Inorganic Data Review* (USEPA 2004) and specific procedural details provided in the analytical method.

All QC criteria (instrument calibrations, calibration check sample recoveries, and frequencies of QC sample analyses) were reviewed and verified manually.

Data validation was performed to assess overall data quality and usability relative to project data quality objectives (DQOs) specified in the project Quality Assurance Project Plan (QAPP).

### **METALS ANALYSIS (SW846 6200)**

#### **1. Timeliness – acceptable**

All samples met project-specific holding time criterion of 180 days for the initial sample analysis.

#### **2. Sample Preparation – acceptable**

Whenever possible, samples were analyzed on an *as-received* basis. In this case, the moisture content and particle-size distribution of each sample aliquot was evaluated by an analyst with extensive experience performing the method. Samples were sieved through a 10-mesh (2-micon) screen in order to remove non-representative and oversized materials.

Samples with appreciable moisture content or consisting of a wide range of particle sizes were heated to apparent dryness and pulverized using a mortar and pestle.

Whether processed or not, representative aliquots of field samples were placed into 37-mm polyethylene XRF sample cups whose exposure (bottom) surface consisted of a single layer of XRF-transparent Mylar film. Filled sample cups were capped then manipulated to facilitate settling of fine-grained material into any void spaces on the exposure surface prior to analysis.

#### **3. Initial Calibrations – acceptable**

For the current project, the Niton instrument employed a single-point internal standard for energy and peak-width calibration. This calibration was performed and verified daily using a three-point calibration curve prepared with NIST-traceable soils standards.

All initial calibrations met the acceptance criteria specified in the analytical method.

**4. Continuing Calibration Check Sample Analysis – acceptable**

The continuing calibration check sample analysis, using the mid-level calibration standard, yielded results that met the frequency and recovery criteria specified in the analytical method.

**5. Detection Limits – acceptable**

Reporting limits, determined on a per-sample basis using signal to noise considerations, were adequate to meet project objectives.

**6. Blank Sample Analysis – acceptable**

a) Method Blanks

The method blank sample consisted of NIST-Traceable Ottawa sand. Laboratory method blank analysis frequency and recovery criteria were met.

b) Instrument Blanks

Project DQOs were not negatively affected by any laboratory blank detections.

**7. Standard Reference Material Analysis (SRM) – acceptable**

Recovery of the analytes from the SRM sample met the acceptance criteria specified in the analytical method.

**8. Matrix Spike Sample Analysis (MS) – not applicable**

Matrix spike analysis is not required by the analytical method.

**9. Laboratory Duplicate Sample Analysis – acceptable**

Laboratory duplicate sample analysis yielded acceptable precision values.

**10. Field Duplicate Sample Analysis – acceptable**

Field duplicate samples analysis yielded acceptable precision values.

**11. Serial Dilution Analysis – not applicable**

Serial dilution analysis is not required by the analytical method..

**12. Interference Check Sample Analysis – not applicable**

Interference check sample analysis is not required by the analytical method.

### 13. Sample Analysis – acceptable

The Niton instrument utilizes Compton scattering to minimize sample matrix effects. The ratio of elastically-scattered radiation to inelastically-scattered radiation (Compton scattering) was used to normalize reported analyte concentrations based on particle size, moisture, and presence of light elements in the sample matrix.

Because the diminished activity of the Cd-109 source, a sample counting time of 240 seconds was used; the Am-240 counting time was also set to 240 seconds.

All laboratory deliverables were present. No discrepancies were noted.

### **Data Assessment and Reconciliation with Project Data Quality Objectives**

Data review and validation was performed by an experienced quality assurance chemist who performed the field laboratory analyses but was not directly involved in the collection of samples for the project.

Although the analytical method followed yielded definitive (defensible) analytical results, independent review is required if the resulting data are to be used for any regulatory purposes.

Upon consideration of the comments and data qualifications noted above and the project data quality objectives specified in the QAPP, the data are ACCEPTABLE for use except where flagged with data qualifiers that modify the usefulness of the individual values.

### **Data Qualifiers**

**Any data qualifiers applied by the laboratory have been removed from the data summary sheets and superceded by data validation qualifiers as follow:**

The following qualifiers are used to modify the data quality and usefulness of individual analytical results.

U - The compound was analyzed for, but was not detected.

## MEMORANDUM

**DATE:** 25 October 2006

**TO:** Ben Castellana, Ph.D., Weston Solutions, Sherman Oaks

**FROM:** Paul Swift, Ph.D., Weston Solutions, Seattle *RSJZ*

**SUBJECT:** Review and Validation – Metals in Soils and Sediments Data  
*Laboratory Group: 06181c*  
*Site: Halaco Engineering Company, Oxnard, California*  
*Project: Integrated Assessment*

**CONTRACT:** GSA W91238-05-F-0052

**WORK ORDER:** 12767.062.317.5000

**cc:** Weston Solutions project file

The quality assurance review and validation of analytical results from metals in soil/sediment samples, laboratory group **06181c**, collected from the Halaco Engineering Company site, 6200 Perkins Road, Oxnard, Ventura County, California between 21 June and 24 June, 2006 has been completed.

The samples were analyzed for CLP Target Analyte List (TAL) metals (aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc), boron, mercury, and molybdenum by the U.S. EPA Region 9 Laboratory, of Richmond, California.

Samples were prepared for analysis of all metals except mercury following EPA SW-846 Method 3050B, acid digestion of sediments, sludges, and soils, and analyzed following EPA Method 6010B, inductively-coupled plasma – atomic emission spectrometry (ICP- AES). Samples submitted for mercury analysis were prepared and analyzed following EPA SW-846 Method 7473/laboratory SOP 535, thermal decomposition, amalgamation, and atomic absorption spectrophotometry (TDA-AAS).

The following samples are included in this quality assurance review.

<b>MY2JJ4</b>	<b>MY2JK7</b>	<b>MY2JM9</b>	<b>MY2JL0</b>
<b>MY2JM6</b>	<b>MY2JN7</b>	<b>MY2JNA</b>	

## **Data Review, Verification, Validation, and Qualification**

The following comments refer to the laboratory performance in meeting the quality control criteria described in the individual analytical methods. The review follows the format described in the *National Functional Guidelines for Inorganic Data Review* (USEPA 2004) and specific procedural details provided in the individual analytical methods and the analytical laboratory's standard operating procedures.

Only sample result and quality control (QC) summary sheets were provided by the laboratory for review and validation. No QC exceedances were noted by the laboratory, other than those described below.

Data validation was performed to assess overall data quality and usability relative to project data quality objectives (DQOs) specified in the project Quality Assurance Project Plan (QAPP).

### **METALS ANALYSIS (SW846 6010B/7473)**

#### **1. Timeliness – acceptable**

All samples met holding time criteria of 180 days for metals and 28 days for mercury for the initial sample analysis.

#### **2. Initial Calibration – not applicable**

Initial calibration data were not provided by the laboratory; however, the laboratory did not note any exceptions.

#### **3. Continuing Calibration Check Sample Analysis – not applicable**

Continuing calibration check sample analysis results were not provided by the laboratory; however, the laboratory did not note any exceptions.

#### **4. Detection Limits – acceptable**

Laboratory method detection limits (MDL) and reporting limits met project-required reporting limits.

#### **5. Blank Sample Analysis – acceptable**

##### **a) Laboratory Method Blanks**

Laboratory method blank frequency and recovery criteria were met.

##### **b) Laboratory Instrument Blanks**

Laboratory instrument blank recoveries were not provided by the laboratory; however, the laboratory did not note any exceptions.

c) Field / Equipment Blanks

No field blanks were associated with this analytical group.

**6. Laboratory Control Sample / Standard Reference Material Analysis (LCS / SRM) – acceptable**

Recovery of the analytes from the LCS/SRM samples met the acceptance criteria in use at the laboratory.

**7. Matrix Spike and Matrix Spike Duplicate Sample Analysis (MS/MSD)**

Analyte recoveries from the MS/MSD samples met laboratory precision and accuracy criteria, with the following exceptions.

- Recoveries of antimony (60%) and nickel (62%) were less than the lower control limit in matrix spike sample **MY2JK7**.
- Recoveries of antimony (61%) and lead (67%) were less than the lower control limit in duplicate spike sample **MY2JK7**.

Results for nickel and lead were qualified as estimated concentrations (J), possible low bias, in the parent sample **MY2JK7** only.

Recovery of antimony from solid matrices is problematic, and additional preparative steps must be employed to achieve acceptable recoveries. Antimony was not detected in any field sample; and results for antimony in all samples were qualified as not detected at an estimated quantitation limit (UJ), unknown bias.

Analyte recoveries from the MS/MSD samples were sufficient to meet project DQOs.

**8. Laboratory Duplicate Sample Analysis – not applicable**

Duplicate sample analysis was not performed for this sample delivery group.

**9. Field Duplicate Sample Analysis – not applicable**

Field duplicate samples were not submitted for analysis.

**10. Serial Dilution Analysis – not applicable**

Serial dilution percent difference determinations were not provided by the laboratory; however, the laboratory did not note any exceptions.

## 11. Interference Check Sample Analysis – *not applicable*

Interference check sample analysis results were not provided by the laboratory; however, the laboratory did not note any exceptions.

## 12. Sample Analysis – *acceptable*

All laboratory deliverables were present. No discrepancies were noted.

### **Laboratory Contact**

No other laboratory contact was required for corrective action purposes.

### **Data Assessment and Reconciliation with Project Data Quality Objectives**

Data review and validation was performed by an experienced quality assurance chemist independent of the analytical laboratory and not directly involved in the collection of samples for the project.

Upon consideration of the comments and data qualifications noted above and the project data quality objectives specified in the QAPP, the data are ACCEPTABLE for use except where flagged with data qualifiers that modify the usefulness of the individual values.

### **Data Qualifiers**

**Any data qualifiers applied by the laboratory have been removed from the data summary sheets and superceded by data validation qualifiers as follow:**

The following qualifiers are used to modify the data quality and usefulness of individual analytical results.

U - The compound was analyzed for, but was not detected.

UJ - The compound was analyzed for, but was not detected. The reported concentration is an estimate of the quantitation limit due to QC exceedance(s).

J - The analyte was positively identified, but the associated numerical value is an estimated quantity because quality control criteria were not met or because concentrations reported are less than the laboratory reporting limit or lowest calibration standard.

## MEMORANDUM

**DATE:** 25 October 2006

**TO:** Ben Castellana, Ph.D., Weston Solutions, Sherman Oaks

**FROM:** Paul Swift, Ph.D., Weston Solutions, Seattle *RSJZ*

**SUBJECT:** Review and Validation – Metals in Soils and Sediments Data  
*Laboratory Group: 06181e*  
*Site: Halaco Engineering Company, Oxnard, California*  
*Project: Integrated Assessment*

**CONTRACT:** GSA W91238-05-F-0052

**WORK ORDER:** 12767.062.317.5000

**cc:** Weston Solutions project file

The quality assurance review and validation of analytical results from metals in soil/sediment samples, laboratory group **06181e**, collected from the Halaco Engineering Company site, 6200 Perkins Road, Oxnard, Ventura County, California between 21 June and 24 June, 2006 has been completed.

The samples were analyzed for CLP Target Analyte List (TAL) metals (aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc), boron, mercury, and molybdenum by the U.S. EPA Region 9 Laboratory, of Richmond, California.

Samples were prepared for analysis of all metals except mercury following EPA SW-846 Method 3050B, acid digestion of sediments, sludges, and soils, and analyzed following EPA Method 6010B, inductively-coupled plasma – atomic emission spectrometry (ICP- AES). Samples submitted for mercury analysis were prepared and analyzed following EPA SW-846 Method 7473/laboratory SOP 535, thermal decomposition, amalgamation, and atomic absorption spectrophotometry (TDA-AAS).

The following samples are included in this quality assurance review.

**MY2JT3**

**MY2JT5**

**MY2JT8**

## **Data Review, Verification, Validation, and Qualification**

The following comments refer to the laboratory performance in meeting the quality control criteria described in the individual analytical methods. The review follows the format described in the *National Functional Guidelines for Inorganic Data Review* (USEPA 2004) and specific procedural details provided in the individual analytical methods and the analytical laboratory's standard operating procedures.

Only sample result and quality control (QC) summary sheets were provided by the laboratory for review and validation. No QC exceedances were noted by the laboratory, other than those described below.

Data validation was performed to assess overall data quality and usability relative to project data quality objectives (DQOs) specified in the project Quality Assurance Project Plan (QAPP).

### **METALS ANALYSIS (SW846 6010B/7473)**

#### **1. Timeliness – acceptable**

All samples met holding time criteria of 180 days for metals and 28 days for mercury for the initial sample analysis.

#### **2. Initial Calibration – not applicable**

Initial calibration data were not provided by the laboratory; however, the laboratory did not note any exceptions.

#### **3. Continuing Calibration Check Sample Analysis – not applicable**

Continuing calibration check sample analysis results were not provided by the laboratory; however, the laboratory did not note any exceptions.

#### **4. Detection Limits – acceptable**

Laboratory method detection limits (MDL) and reporting limits met project-required reporting limits.

#### **5. Blank Sample Analysis – acceptable**

##### **a) Laboratory Method Blanks**

Laboratory method blank frequency and recovery criteria were met.

##### **b) Laboratory Instrument Blanks**

Laboratory instrument blank recoveries were not provided by the laboratory; however, the laboratory did not note any exceptions.

c) Field / Equipment Blanks

No field blanks were associated with this analytical group.

**6. Laboratory Control Sample / Standard Reference Material Analysis (LCS / SRM) – acceptable**

Recovery of the analytes from the LCS/SRM samples met the acceptance criteria in use at the laboratory, with the following exceptions.

- Recoveries of silver (143% / 185%) exceeded the upper control limit for this analyte for duplicate SRM sample analyses. Recoveries of silver were within control limits for both the matrix and duplicate spike samples and the method blank samples. No data were qualified for this event.

**7. Matrix Spike and Matrix Spike Duplicate Sample Analysis (MS/MSD) – acceptable**

Analyte recoveries from the MS/MSD samples met laboratory precision and accuracy criteria, with the following exceptions.

- Recoveries of chromium (72%) and cobalt (66%) were less than the lower control limit in matrix spike sample **MY2JT2**.
- Recoveries of cobalt (66%) and sodium (70%) were less than the lower control limit in duplicate spike sample **MY2JT2**.

Results for the parent sample **MY2JK7** were not evaluated as part of this review. Since cobalt recoveries from the duplicate SRM analyses, no data were qualified for this event.

Recovery of chromium from the MS sample was slightly less than the lower control limit and may be attributable to sample homogeneity. Although recovery of sodium was less than the lower control limit from the MSD sample, this analyte is not used in Hazard Ranking System scoring and no data were qualified for this event.

Analyte recoveries from the MS/MSD samples were sufficient to meet project DQOs.

**8. Laboratory Duplicate Sample Analysis – not applicable**

Duplicate sample analysis was not performed for this sample delivery group.

**9. Field Duplicate Sample Analysis – *not applicable***

Field duplicate samples were not submitted for analysis.

**10. Serial Dilution Analysis – *not applicable***

Serial dilution percent difference determinations were not provided by the laboratory; however, the laboratory did not note any exceptions.

**11. Interference Check Sample Analysis – *not applicable***

Interference check sample analysis results were not provided by the laboratory; however, the laboratory did not note any exceptions.

**12. Sample Analysis – *acceptable***

All laboratory deliverables were present. No discrepancies were noted.

**Laboratory Contact**

No other laboratory contact was required for corrective action purposes.

**Data Assessment and Reconciliation with Project Data Quality Objectives**

Data review and validation was performed by an experienced quality assurance chemist independent of the analytical laboratory and not directly involved in the collection of samples for the project.

Upon consideration of the comments and data qualifications noted above and the project data quality objectives specified in the QAPP, the data are ACCEPTABLE for use except where flagged with data qualifiers that modify the usefulness of the individual values.

**Data Qualifiers**

**Any data qualifiers applied by the laboratory have been removed from the data summary sheets and superceded by data validation qualifiers as follow:**

The following qualifiers are used to modify the data quality and usefulness of individual analytical results.

**U -** The compound was analyzed for, but was not detected.

**J -** The analyte was positively identified, but the associated numerical value is an estimated quantity because quality control criteria were not met or because concentrations reported are less than the laboratory reporting limit or lowest calibration standard.

### Qualifiers and Comments

- Q6 Matrix spike/matrix spike duplicate precision criteria were not met for this analyte (see MS/MSD results for this batch in QC summary).
- Q4 The matrix spike and/or matrix spike duplicate associated with this sample did not meet recovery criteria for this analyte (see MS/MSD results for this batch in QC summary)
- Q10 The analyte concentration in the unfortified sample is significantly greater than the concentration spiked into the matrix spike and matrix spike duplicate. The reported spike recovery is not a meaningful measure of the dataset's analytical accuracy.
- J The reported result for this analyte should be considered an estimated value.
- C1 The reported concentration for this analyte is below the quantitation limit.
- U Not Detected
- NR Not Reported

### Qualifiers and Comments

LK 4he matrix spike and/or matrix spike duplicate associated with this sample did not meet recovery criteria for this analyte (see MS/MSD results for this Eatch in Lb summary)

L10 4he analyte concentration in the unfortified sample is significantly greater than the concentration spiked into the matrix spike and matrix spike duplicateT 4he reported spike recovery is not a meaningful measure of the dataset's analytical accuracyT

J 4he reported result for this analyte should Ee considered an estimated valueT

b1 4he reported concentration for this analyte is Eelow the quantitation limitT

A-01 4he recovery in the SRM did not meet Lb criteria for this analyteT

ESAT Contract No.: EP-W-06-041  
Technical Direction Form No.: 00105013 Amendment 1

**DATE:** September 14, 2006

**SUBJECT:** Review of Analytical Data, Tier 3

Attached are comments resulting from ESAT Region 9 review of the following analytical data:

Site:	Halaco
Site Account No.:	09 X6 LA00
CERCLIS ID No.:	CAD00968805
Case No.:	35429
SDG No.:	MY2JJ5
Laboratory:	Bonner Analytical Testing Company (BONNER)
Analysis:	CLP Total Metals
Samples:	8 Sediment and 12 Soil Samples (see Case Summary)
Collection Date:	June 20, 22, 23, and 26, 2006
Reviewer:	Stan Kott, ESAT/Laboratory Data Consultants

This report has been reviewed by the EPA TOM for the ESAT contract, whose signature appears above.

If there are any questions, please contact Rose Fong (QA Program/EPA) at (415) 972-3812.

## Data Validation Report

Case No.: 35429  
SDG No.: MY2JJ5  
Site: Halaco  
Laboratory: Bonner Analytical Testing Company (BONNER)  
Reviewer: Stan Kott, ESAT/LDC  
Date: September 14, 2006

### I. CASE SUMMARY

#### Sample Information

Sediment Samples: MY2JJ5 through MY2JJ9, MY2JQ6, MY2JQ7, and MY2JQ8  
Soil Samples: MY2JL1, MY2JL2, MY2JL3, MY2JL5 through MY2JL9, and MY2JM0 through MY2JM3  
Concentration and Matrix: Low Concentration Sediment and Soil  
Analysis: CLP Total Metals  
SOW: ILM05.3  
Collection Date: June 20, 22, 23, and 26, 2006  
Sample Receipt Date: July 1, 2006  
Preparation Date: July 7 and 10, 2006  
Analysis Date: July 8, 10, and 12, 2006

#### Field QC

Field Blanks (FB): Not Provided  
Equipment Blanks (EB): Not Provided  
Background Samples (BG): MY2JM0 through MY2JM3 (See Additional Comments)  
Field Duplicates (D1): MY2JJ7 and MY2M80 (See Additional Comments)  
Field Duplicates (D2): MY2JL8 and MY2MB9 (See Additional Comments)  
Duplicates (D3): MY2JQ7 and MY2MC3 (See Additional Comments)

#### Laboratory QC

Method Blanks & Associated Samples: Preparation Blank- Soil (PBS) and samples listed above

Matrix Spike: MY2JQ6S  
Duplicate: MY2JQ6D  
ICP Serial Dilution: MY2JQ6L

Analysis: CLP Total Metals

Analyte	Sample Preparation and Digestion Date	Analysis Date
ICP-AES Metals	July 7, 2006	July 8 and 12, 2006
Mercury	July 10, 2006	July 10, 2006
Percent Solids	July 7, 2006	July 10, 2006

#### CLP PO Action

Non-detected results for antimony and silver are rejected (R) since less than 30% of the matrix spike and less than 75% of the post-digestion spike were recovered. (See Comment A for affected samples.)

## Sampling Issues

1. The samples were shipped in a cardboard box without a temperature indicator bottle or ice and arrived at the laboratory with a temperature of 25.5°C. Since the mercury samples arrived at a temperature greater than both the 4°±2 °C SOW limit and the 20.0°C Region 9 maximum temperature limit, results for mercury are estimated "J" or "UJ".
2. The Traffic Report/Chain of Custody (TR/COC) record form did not specify a sample to be used for laboratory quality control (QC). The laboratory selected sample MY2JQ6 for QC analysis. The effect on data quality is not known.
3. Sample MY2JM5 is listed as both the field duplicate to sample MY2JR6 and a background sample on the Field QA/QC Summary Form. The effect on data quality is not known.

## Additional Comments

Results for sample MY2M80, the field duplicate of sample MY2JJ7, are included in Case 35429 SDG MY2M69.

Results for sample MY2MB9, the field duplicate of sample MY2JL8, are included in Case 35429 SDG MY2MA3.

Results for sample MY2MC3, the field duplicate of sample MY2JQ7, are included in Case 35429 SDG MY2JR5.

The results for several analytes in background samples MY2JM0 through MY2JM3 exceed the respective contract required quantitation limits (CRQLs). Refer to Table 1A for background sample results.

The results for background soil samples MY2JM4 and MY2JM5 collected on June 20, 2006 with background soil samples MY2JM0 through MY2JM3 in this SDG can be found in SDG MY2JM4.

Samples MY2JL1, MY2JL2, MY2JL3, MY2JL5 through MY2JL9, MY2JM3, MY2JQ6, MY2JQ7, and MY2JQ8 were analyzed at a 3, 4, or 10-fold dilution for aluminum, manganese, potassium, sodium, or zinc due to analyte concentrations that exceed the instrument's linear range. No adverse effect on data quality is expected.

All method requirements specified in the EPA Contract Laboratory Program (CLP) Inorganic Statement of Work (SOW), except as noted, have been met.

Analytical results are listed in Table 1A with qualifications. Definitions of data qualifiers used in Table 1A are listed in Table 1B.

This report was prepared in accordance with the following documents:

- ▼ Region 9 Standard Operating Procedure 906, *Guidelines for Data Review of Contract Laboratory Program Analytical Services (CLPAS) Inorganic Data Packages*;
- ▼ USEPA Contract Laboratory Program Statement of Work For Inorganic Analysis Multi-Media, Multi-Concentration ILM05.3, March 2004; and
- ▼ USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004.

## II. VALIDATION SUMMARY

The data were evaluated based on the following parameters:

	<u>Parameter</u>	<u>Acceptable</u>	<u>Comment</u>
1.	Data Completeness	Yes	
2.	Sample Preservation and Holding Times	No	C
3.	Calibration	Yes	
a.	Initial		
b.	Initial and Continuing Calibration Verification		
c.	CRQL Check Standard (CRI)		
4.	Blanks	Yes	D
5.	ICP Interference Check Sample (ICS)	Yes	
6.	Laboratory Control Sample (LCS)	Yes

N/A = Not Applicable

## III. VALIDITY AND COMMENTS

- A. The following non-detected results are rejected and flagged "R" in Table 1A because matrix spike and post-digestion spike recoveries do not meet method QC limits.
- ▼ Antimony in samples MY2JJ5 through MY2JJ9, MY2JL2, and MY2JM0 through MY2JM3
  - ▼ Silver in all samples except MY2JM3

Matrix spike (MY2JQ6S) and post-digestion spike (MY2JQ6A) recovery results for antimony and silver did not meet the 75-125% criteria for accuracy. The percent recovery for each analyte is presented below and is based on an ideal recovery of 100%.

Analyte	Matrix Spike Recovery, %	Post-Digestion Spike Recovery, %
Antimony	26	42
Silver	0	0

The results reported for antimony and silver in samples listed above are below the method detection limit (MDL) and are considered unacceptable because less than 30% of the matrix spike and less than 75% of the post-digestion spike were recovered. Since both the post- and pre-digestion spikes did not meet the QC criteria, matrix effects may be present in the sample digestate that may depress the analyte signal during analysis. The low recoveries indicate an analytical deficiency and false negatives may exist.

*Matrix spike sample analysis provides information about the effect of the sample matrix on sample preparation and measurement methodology.*

- B. Results above the MDL but below the contract required quantitation limit (CRQL) (denoted with an "L" qualifier) are estimated and flagged "J" in Table 1A.

*Results above the MDL but below the CRQL are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of quantitation.*

- C. The following results are estimated and flagged "J" or "UJ" in Table 1A due to inadequate sample preservation.

- ▼ Mercury in all samples

The samples arrived at the laboratory at a temperature of 25.5°C. Samples did not meet both the 4°±2 °C SOW temperature criterion or the 20.0°C Region 9 maximum temperature criterion. Sample results for mercury may be biased low and, where non-detected, false negatives may exist.

- D. The following result is reported as non-detected (U) in Table 1A due to low level continuing calibration blank (CCB) contamination.

- ▼ Beryllium in sample MY2JM0

The concentration for beryllium (0.077µg/L in CCB4) is greater than the MDL but less than the CRQL. Sample results greater than or equal to the MDL but less than the CRQL are reported as non-detected (U) at the CRQL.

*A continuing calibration blank (CCB) consists of deionized, distilled water and reagents. It is analyzed after the continuing calibration verification (CCV) standard, at a frequency of every 10 samples and at the end of the analytical run to monitor analyte carry-over.*

- E. The following results are estimated and flagged "J", "J-", or "UJ" in Table 1A because matrix spike recovery results are outside method QC limits.

- ▼ Antimony in samples MY2JL1, MY2JL3, MY2JL5 through MY2JL9, MY2JQ6, MY2JQ7, and MY2JQ8
- ▼ Selenium in all samples
- ▼ Silver in sample MY2JM3

Matrix spike recovery results for antimony, selenium, and silver in QC sample MY2JQ6S did not meet the 75-125% criteria for accuracy. The percent recovery and possible percent bias for the analytes are presented below and are based on an ideal recovery of 100%.

Analyte	% Recovery	% Bias
Antimony	26	-74
Selenium	69	-31
Silver	0	-100

Results above the MDL are considered quantitatively uncertain. Results reported for antimony, selenium, and silver in the samples listed above may be biased low.

According to the inorganic SOW, when the pre-digestion spike recovery results for ICP analytes fall outside the 75-125% control limits, a post-digestion spike must be performed for those elements that do not meet the specified criteria. The following post-digestion spike recovery results for sample MY2JQ6A were obtained.

Analyte	Post-Digestion Spike, % Recovery
Antimony	42
Selenium	177
Silver	0

Since both the post- and pre-digestion spikes did not meet the QC criteria, matrix effects may be present in the sample digestate which may interfere with accurate analysis.

*The matrix spike sample analysis provides information about the effect of the sample matrix on the digestion and measurement methodology.*

- F. The following relative percent differences (RPDs) or absolute differences were obtained for field duplicate pairs listed below.

Analyte	MY2JJ7 D1 MY2M80 D1	MY2JL8 D2 MY2MB9 D2	MY2JQ7 D3 MY2MC3 D3
	Result	Result	Result
Aluminum	52 RPD	--	--
Barium	--	--	53 RPD
Calcium	101 RPD	--	--
Chromium	51 RPD	--	--
Cobalt	--	--	16.8 mg/kg, difference
Copper	81 RPD	--	--
Iron	49 RPD	--	46 RPD
Lead	4.4 mg/kg, difference	--	48 RPD
Magnesium	1,200 mg/kg, difference	--	--
Manganese	74 RPD	--	36 RPD
Vanadium	--	36 RPD	--
Zinc	42.5 mg/kg, difference	--	--

Since sampling variability is included in the measurement, field duplicate results are expected to vary more than laboratory duplicates which have a ▶35 RPD or ▶2 times CRQL absolute difference criteria for precision. The effect on the quality of the data is not known.

*The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results of the analysis of the field duplicate pair may be due to the sample matrix, high levels of solids in the sample, or poor sampling or laboratory technique.*

**TABLE 1B**  
**DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW**

The definitions of the following qualifiers are prepared in accordance with the document *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, October 2004.

- U     The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- J     The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- J+    The result is an estimated quantity, but the result may be biased high.
- J-    The result is an estimated quantity, but the result may be biased low.
- R     The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.
- UJ    The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

## Data Validation Report

Case No.: 35429  
SDG No.: MY2JM4  
Site: Halaco  
Laboratory: Bonner Analytical Testing Company (BONNER)  
Reviewer: Stan Kott, ESAT/LDC  
Date: September 20, 2006

### I. CASE SUMMARY

#### Sample Information

Sediment Samples: MY2JQ4, MY2JQ5, MY2JQ9, MY2JR0 through MY2JR4, MY2M74, MY2M75, and MY2M76

Soil Samples: MY2JK0 through MY2JK5, MY2JL4, MY2JM4, and MY2JM5

Concentration and Matrix: Low Concentration Sediment and Soil  
Analysis: CLP Total Metals  
SOW: ILM05.3

Collection Date: June 19, 20, 21, 23, 26, and 28, 2006

Sample Receipt Date: July 1, 2006

Preparation Date: July 7, 10, and 11, 2006

Analysis Date: July 10, 11, and 12, 2006

#### Field QC

Field Blanks (FB): Not Provided

Equipment Blanks (EB): Not Provided

Background Samples (BG): MY2JM4, MY2JM5, MY2JQ9, MY2JR0 through MY2JR4, MY2M74, MY2M75, and MY2M76 (See Additional Comments)

Field Duplicates (D1): MY2JM5 and MY2JR6 (See Additional Comments)

#### Laboratory QC

Method Blanks & Associated Samples: Preparation Blank-Soil (PBS) and samples listed above

Matrix Spike: MY2JM5S

Duplicate: MY2JM5D

ICP Serial Dilution: MY2JM5L

Analysis: CLP Total Metals

Analyte	Sample Preparation and Digestion Date	Analysis Date
ICP-AES Metals	July 10, 2006	July 11 and 12, 2006
Mercury	July 11, 2006	July 11, 2006
Percent Solids	July 7, 2006	July 10, 2006

#### CLP PO Action

None.

### Sampling Issues

1. The samples were shipped in a cardboard box without a temperature indicator bottle or ice and arrived at the laboratory with a temperature of 25.5°C. Since the mercury samples arrived at a temperature greater than both the 4°±2°C SOW limit and the 20.0°C Region 9 maximum temperature limit, results for mercury are estimated "J" or "UJ".
2. The Traffic Report/Chain of Custody (TR/COC) record form did not specify a sample to be used for laboratory quality control (QC). The laboratory selected sample MY2JM5 for QC analysis. The effect on data quality is not known.
3. Sample MY2JM5 is listed as both the field duplicate to sample MY2JR6 and a background sample on the Field QA/QC Summary Form. The effect on data quality is not known.

### Additional Comments

Results for sample MY2JR6, the field duplicate of sample MY2JM5, are included in Case 35429 SDG MY2JR5.

The results for background soil samples MY2JM0 through MY2JM3, collected on June 20, 2006 with samples MY2JM4 and MY2JM5 in this SDG, can be found in SDG MY2JJ5.

Samples MY2JK2 through MY2JK5, and MY2JL4 were analyzed at a 2, 3, or 7-fold dilution due to analyte concentrations that exceed the instrument's linear range. No adverse effect on data quality is expected.

All method requirements specified in the EPA Contract Laboratory Program (CLP) Inorganic Statement of Work (SOW), except as noted, have been met.

Analytical results are listed in Table 1A with qualifications. Definitions of data qualifiers used in Table 1A are listed in Table 1B.

This report was prepared in accordance with the following documents:

- ▼ Region 9 Standard Operating Procedure 906, *Guidelines for Data Review of Contract Laboratory Program Analytical Services (CLPAS) Inorganic Data Packages*;
- ▼ USEPA Contract Laboratory Program Statement of Work For Inorganic Analysis Multi-Media, Multi-Concentration ILM05.3, March 2004; and
- ▼ USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004.

## **II. VALIDATION SUMMARY**

The data were evaluated based on the following parameters:

	<u>Parameter</u>	<u>Acceptable</u>	<u>Comment</u>
1.	Data Completeness	Yes	
2.	Sample Preservation and Holding Times	No	B
3.	Calibration	Yes	
a.	Initial		
b.	Initial and Continuing Calibration Verification		
c.	CRQL Check Standard (CRI)		
4.	Blanks	Yes	C
5.	ICP Interference Check Sample (ICS)	Yes	
6.	Laboratory Control Sample (LCS)	Yes	
7.	Duplicate Sample Analysis	Yes	
8.	Matrix Spike Sample Analysis	No	D
9.	ICP Serial Dilution Analysis	Yes	
10.	ICP-MS Internal Standards	N/A	
11.	Field Duplicate Sample Analysis	Yes	
12.	Sample Quantitation	Yes	A
13.	Overall Assessment	Yes	

N/A = Not Applicable

## **III. VALIDITY AND COMMENTS**

- A. Results above the method detection limit (MDL) but below the contract required quantitation limit (CRQL) (denoted with an "L" qualifier) are estimated and flagged "J" in Table 1A.

*Results above the MDL but below the CRQL are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of quantitation.*

- B. The following results are estimated and flagged "J" or "UJ" in Table 1A due to inadequate sample preservation.

- ▼ Mercury in all samples

The samples arrived at the laboratory at a temperature of 25.5°C. Samples did not meet either the 4°±2 °C SOW temperature criterion or the 20.0°C Region 9 maximum temperature criterion. Sample results for mercury may be biased low and, where non-detected, false negatives may exist.

- C. The following results are reported as non-detected (U) in Table 1A due to low level preparation blank (PBS) and continuing calibration blank (CCB) contamination.

- ▼ Sodium in samples MY2JK0, MY2JK1, MY2JQ9, MY2JR0 through MY2JR4, and MY2M76

The concentration for sodium (74.4 mg/kg) in preparation blank PBS is greater than the MDL but less than the CRQL. The values for sodium in the CCBs ranged from a low of 33.9 mg/kg to a high of 57.0 mg/kg and are greater than the MDL but less than the CRQL. Sample results greater than or equal to the MDL but less than the CRQL are reported as non-detected (U) at the CRQL.

*A preparation blank is an analytical control that contains distilled, deionized water, or baked sand for solid matrices, and reagents, which is carried through the entire analytical procedure. The preparation blank is used to determine the level of contamination introduced by the laboratory during preparation and analysis.*

*A continuing calibration blank (CCB) consists of deionized, distilled water and reagents. It is analyzed after the continuing calibration verification (CCV) standard, at a frequency of every 10 samples and at the end of the analytical run to monitor analyte carry-over.*

- D. The following results are estimated and flagged "J" or "UJ" in Table 1A because a matrix spike recovery result is outside method QC limits.

▼ Antimony in all samples

Matrix spike recovery result for antimony in QC sample MY2JM5S did not meet the 75-125% criteria for accuracy. The percent recovery and possible percent bias for antimony are presented below and are based on an ideal recovery of 100%.

Analyte	% Recovery	% Bias
Antimony	19	-81

Results above the MDL are considered quantitatively uncertain. Results reported for antimony in all the samples may be biased low.

According to the inorganic SOW, when the pre-digestion spike recovery results for ICP analytes fall outside the 75-125% control limits, a post-digestion spike must be performed for those elements that do not meet the specified criteria. The following post-digestion spike recovery result for sample MY2JM5A was obtained.

Analyte	Post-Digestion Spike, % Recovery
Antimony	85

Since the post-digestion spike recovery was acceptable, the low pre-digestion spike recovery result (19%) obtained for antimony may indicate sample non-homogeneity, poor laboratory technique, or matrix effects which may interfere with accurate analysis, depressing the analytical result.

*The matrix spike sample analysis provides information about the effect of the sample matrix on the digestion and measurement methodology.*

**TABLE 1B**

**DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW**

The definitions of the following qualifiers are prepared in accordance with the document *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, October 2004.

- U     The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- J     The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- J+    The result is an estimated quantity, but the result may be biased high.
- J-    The result is an estimated quantity, but the result may be biased low.
- R     The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.
- UJ    The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

## Data Validation Report

Case No.: 35429  
SDG No.: MY2JR5  
Site: Halaco  
Laboratory: Bonner Analytical Testing Company (BONNER)  
Reviewer: Stan Kott, ESAT/LDC  
Date: September 14, 2006

### I. CASE SUMMARY

#### Sample Information

Sediment Samples: MY2JR5 and MY2MC3  
Soil Sample: MY2JR6  
Concentration and Matrix: Low Concentration Sediment and Soil  
Analysis: CLP Total Metals  
SOW: ILM05.3  
Collection Date: June 20 and 23, 2006  
Sample Receipt Date: July 1, 2006  
Preparation Date: July 7 and 11, 2006  
Analysis Date: July 10, 11, 13, and 14, 2006

#### Field QC

Field Blanks (FB): Not Provided  
Equipment Blanks (EB): Not Provided  
Background Samples (BG): (See Additional Comments)  
Field Duplicates (D1): MY2JR6 and MY2JM5 (See Additional Comments)  
Field Duplicates (D2): MY2MC3 and MY2LQ7 (See Additional Comments)

#### Laboratory QC

Method Blanks & Associated Samples: Preparation Blank- Soil (PBS) and samples listed above

Matrix Spike: MY2JQ6S  
Duplicate: MY2JQ6D  
ICP Serial Dilution: MY2JQ6L

Analysis: CLP Total Metals

<u>Analyte</u>	<u>Sample Preparation and Digestion Date</u>	<u>Analysis Date</u>
ICP-AES Metals	July 7, 2006	July 13 and 14, 2006
Mercury	July 11, 2006	July 11, 2006
Percent Solids	July 7, 2006	July 10, 2006

#### CLP PO Action

None.

## Sampling Issues

1. The samples were shipped in a cardboard box without a temperature indicator bottle or ice and arrived at the laboratory with a temperature of 25.5°C. Since the mercury samples arrived at a temperature greater than both the 4°±2 °C SOW limit and the 20.0°C Region 9 maximum temperature limit, results for mercury are estimated "J" or "UJ".
2. The Traffic Report/Chain of Custody (TR/COC) record form did not specify a sample to be used for laboratory quality control (QC). The laboratory selected sample MY2JQ6 for QC analysis. The effect on data quality is not known.
3. Sample MY2JM5 is listed as both the field duplicate to sample MY2JR6 and a background sample on the Field QA/QC Summary Form. The effect on data quality is not known.

## Additional Comments

Results for sample MY2JM5, the field duplicate of sample MY2JR6, are included in Case 35429 SDG MY2JM4.

Results for sample MY2JQ7, the field duplicate of sample MY2MC3, are included in Case 35429 SDG MY2JJ5.

The results for background soil samples MY2JM0 through MY2JM3 and background soil samples MY2JM4 and MY2JM5, collected on June 20, 2006 with sample MY2JR6 in this SDG, can be found in SDG MY2JJ5 and SDG MY2JM4, respectively.

Sample MY2JR6 was analyzed at a 3-fold dilution for sodium and samples MY2JR5 and MY2MC3 were analyzed at a 5-fold dilution for aluminum and barium due to analyte concentrations that exceed the instrument's linear range. No adverse effect on data quality is expected.

All method requirements specified in the EPA Contract Laboratory Program (CLP) Inorganic Statement of Work (SOW), except as noted, have been met.

Analytical results are listed in Table 1A with qualifications. Definitions of data qualifiers used in Table 1A are listed in Table 1B.

This report was prepared in accordance with the following documents:

- ▼ Region 9 Standard Operating Procedure 906, *Guidelines for Data Review of Contract Laboratory Program Analytical Services (CLPAS) Inorganic Data Packages*;
- ▼ USEPA Contract Laboratory Program Statement of Work For Inorganic Analysis Multi-Media, Multi-Concentration ILM05.3, March 2004; and
- ▼ USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004.

## **II. VALIDATION SUMMARY**

The data were evaluated based on the following parameters:

	<u>Parameter</u>	<u>Acceptable</u>	<u>Comment</u>
1.	Data Completeness	Yes	
2.	Sample Preservation and Holding Times	No	B
3.	Calibration	Yes	
a.	Initial		
b.	Initial and Continuing Calibration Verification		
c.	CRQL Check Standard (CRI)		
4.	Blanks	Yes	
5.	ICP Interference Check Sample (ICS)	Yes	
6.	Laboratory Control Sample (LCS)	Yes	
7.	Duplicate Sample Analysis	Yes	
8.	Matrix Spike Sample Analysis	No	C
9.	ICP Serial Dilution Analysis	No	D
10.	ICP-MS Internal Standards	N/A	
11.	Field Duplicate Sample Analysis	No	E
12.	Sample Quantitation	Yes	A
13.	Overall Assessment	Yes	

N/A = Not Applicable

## **III. VALIDITY AND COMMENTS**

- A. Results above the method detection limit (MDL) but below the contract required quantitation limit (CRQL) (denoted with an "L" qualifier) are estimated and flagged "J" in Table 1A.

*Results above the MDL but below the CRQL are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of quantitation.*

- B. The following results are estimated and flagged "J" or "UJ" in Table 1A due to inadequate sample preservation.

- ▼ Mercury in all samples

The samples arrived at the laboratory at a temperature of 25.5°C. Samples did not meet either the 4°±2 °C SOW temperature criterion or the 20.0°C Region 9 maximum temperature criterion. Sample results for mercury may be biased low and, where non-detected, false negatives may exist.

- C. The following results are estimated and flagged "J" or "UJ" in Table 1A because a matrix spike recovery result is outside method QC limits.

- ▼ Antimony in all samples

Matrix spike recovery result for antimony in QC sample MY2JR6S did not meet the 75-125% criteria for accuracy. The percent recovery and possible percent bias for antimony are presented below and are based on an ideal recovery of 100%.

Analyte	% Recovery	% Bias
Antimony	21	-79

Results above the MDL are considered quantitatively uncertain. Results reported for antimony in all the samples may be biased low.

According to the inorganic SOW, when the pre-digestion spike recovery results for ICP analytes fall outside the 75-125% control limits, a post-digestion spike must be performed for those elements that do not meet the specified criteria. The following post-digestion spike recovery result for sample MY2JR6A was obtained.

Analyte	Post-Digestion Spike, % Recovery
Antimony	93

Since the post-digestion spike recovery was acceptable, the low pre-digestion spike recovery result (21%) obtained for antimony may indicate sample non-homogeneity, poor laboratory technique, or matrix effects which may interfere with accurate analysis, depressing the analytical result.

*The matrix spike sample analysis provides information about the effect of the sample matrix on the digestion and measurement methodology.*

- D. The following results are estimated and flagged "J" in Table 1A because an ICP serial dilution result is outside method QC limits.
- ▼ Cobalt in all samples

The percent difference for the ICP serial dilution analysis of sample MY2JR6L did not meet the 10% criterion for cobalt as shown below.

Analyte	% Difference
Cobalt	+12

Results reported for cobalt in all samples are considered quantitatively uncertain. Chemical and physical interferences may exist due to sample matrix effects. The result for the diluted sample was higher than the original. Therefore, the reported sample results for cobalt may be biased low.

*A five-fold dilution of the laboratory QC sample is performed in association with the ICP procedure to indicate whether interference exists due to sample matrix effects. If the analyte concentration is sufficiently high (minimally a factor of 50 above the MDL in the original sample), the five fold serial dilution must agree within 10% of the original results after correction for dilution.*

- E. The following relative percent differences (RPDs) or absolute difference were obtained for the field duplicate pair listed below.

MY2JQ7 D3 MY2MC3 D3	
Analyte	Result
Barium	53 RPD
Cobalt	16.8 mg/kg difference
Iron	46 RPD
Lead	48 RPD
Manganese	36 RPD

Since sampling variability is included in the measurement, field duplicate results are expected to vary more than laboratory duplicates which have a ▼35 RPD or ▼2 times CRQL absolute difference criteria for precision. The effect on the quality of the data is not known.

*The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results of the analysis of the field duplicate pair may be due to the sample matrix, high levels of solids in the sample, or poor sampling or laboratory technique.*

**TABLE 1B**  
**DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW**

The definitions of the following qualifiers are prepared in accordance with the document *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, October 2004.

- U     The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- J     The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- J+    The result is an estimated quantity, but the result may be biased high.
- J-    The result is an estimated quantity, but the result may be biased low.
- R     The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.
- UJ    The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

### I. CASE SUMMARY

#### Sample Information

Sediment Samples: MY2M69 through MY2M73, MY2M77, MY2M78, MY2M79, MY2M80 through MY2M89, MY2MA1, and MY2MA2  
Concentration and Matrix: Low Concentration Sediment  
Analysis: CLP Total Metals  
SOW: ILM05.3  
Collection Date: June 20, 21, 23, 28, and 29, 2006  
Sample Receipt Date: July 1, 2006  
Preparation Date: July 7 and 11, 2006  
Analysis Date: July 10, 11, and 14, 2006

#### Field QC

Field Blanks (FB): Not Provided  
Equipment Blanks (EB): Not Provided  
Background Samples (BG): MY2JM77 through MY2M79 and MY2M81 through MY2M86  
Field Duplicates (D1): MY2M80 and MY2JJ7 (See Additional Comments)  
Field Duplicates (D2): MY2M88 and MY2MA4 (See Additional Comments)

#### Laboratory QC

Method Blanks & Associated Samples: Preparation Blank-Soil (PBS) and samples listed above  
Matrix Spike: MY2M84S  
Duplicate: MY2M84D  
ICP Serial Dilution: MY2M84L  
Analysis: CLP Total Metals

Analyte	Sample Preparation and Digestion Date	Analysis Date
ICP-AES Metals	July 7, 2006	July 11 and 14, 2006
Mercury	July 11, 2006	July 11, 2006
Percent Solids	July 7, 2006	July 10, 2006

#### CLP PO Action

None.

## Sampling Issues

1. The samples were shipped in a cardboard box without a temperature indicator bottle or ice and arrived at the laboratory with a temperature of 25.5°C. Since the mercury samples arrived at a temperature greater than both the 4°±2 °C SOW limit and the 20.0°C Region 9 maximum temperature limit, results for mercury are estimated "J" or "UJ".
2. The Traffic Report/Chain of Custody (TR/COC) record form did not specify a sample to be used for laboratory quality control (QC). The laboratory selected sample MY2M84 for QC analysis. The effect on data quality is not known.

## Additional Comments

Several Form 12s in the data package require correction. The corrected forms were requested from the laboratory but have not been received to date. Data quality is not likely to be affected and this report is considered final. (See attached communication record log.)

Results for sample MY2 JJ7, the field duplicate of sample MY2M80, are included in Case 35429 SDG MY2JJ5.

Results for sample MY2MA4, the field duplicate of sample MY2M88, are included in Case 35429 SDG MY2MA3.

The results for several analytes in the background samples exceed the respective contract required quantitation limits (CRQLs). Refer to Table 1A for background sample results.

All method requirements specified in the EPA Contract Laboratory Program (CLP) Inorganic Statement of Work (SOW), except as noted, have been met.

Analytical results are listed in Table 1A with qualifications. Definitions of data qualifiers used in Table 1A are listed in Table 1B.

This report was prepared in accordance with the following documents:

- ▼ Region 9 Standard Operating Procedure 906, *Guidelines for Data Review of Contract Laboratory Program Analytical Services (CLPAS) Inorganic Data Packages*;
- ▼ USEPA Contract Laboratory Program Statement of Work For Inorganic Analysis Multi-Media, Multi-Concentration ILM05.3, March 2004; and
- ▼ USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004.

## **II. VALIDATION SUMMARY**

The data were evaluated based on the following parameters:

	<u>Parameter</u>	<u>Acceptable</u>	<u>Comment</u>
1.	Data Completeness	Yes	
2.	Sample Preservation and Holding Times	No	B
3.	Calibration	Yes	
a.	Initial		
b.	Initial and Continuing Calibration Verification		
c.	CRQL Check Standard (CRI)		
4.	Blanks	Yes	
5.	ICP Interference Check Sample (ICS)	Yes	
6.	Laboratory Control Sample (LCS)	Yes	
7.	Duplicate Sample Analysis	No	C
8.	Matrix Spike Sample Analysis	No	D
9.	ICP Serial Dilution Analysis	Yes	
10.	Field Duplicate Sample Analysis	No	E
11.	Sample Quantitation	Yes	A
12.	Overall Assessment	Yes	

N/A = Not Applicable

## **III. VALIDITY AND COMMENTS**

- A. Results above the method detection limit (MDL) but below the CRQL (denoted with an "L" qualifier) are estimated and flagged "J" in Table 1A.

*Results above the MDL but below the CRQL are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of quantitation.*

- B. The following results are estimated and flagged "J" or "UJ" in Table 1A due to inadequate sample preservation.

- ▼ Mercury in all samples

The samples arrived at the laboratory at a temperature of 25.5°C. Samples did not meet either the  $4^{\circ}\pm2^{\circ}$ C SOW temperature criterion or the 20.0°C Region 9 maximum temperature criterion. Sample results for mercury may be biased low and, where non-detected, false negatives may exist.

- C. The following results are estimated and flagged "J" in Table 1A because of a laboratory duplicate result outside method QC limits.

- ▼ Calcium in all samples

Laboratory duplicate results for sample MY2M84D do not meet ▼ 35 relative percent difference (RPD) criterion for precision as listed below.

Analyte	Laboratory Duplicate, RPD
Calcium	69

Results for calcium in all samples are considered quantitatively uncertain.

*Duplicate analyses demonstrate the analytical precision obtained for each sample matrix. The imprecision between duplicate results may be due to sample non-homogeneity, or poor laboratory technique.*

- D. The following results are estimated and flagged "J" or "UJ" in Table 1A because matrix spike recovery results are outside method QC limits.

- ▼ Antimony in all samples
- ▼ Arsenic in all samples

Matrix spike recovery results for antimony and arsenic in QC sample MY2M84S did not meet the 75-125% criteria for accuracy. The percent recovery and possible percent bias for the analytes are presented below and are based on an ideal recovery of 100%.

Analyte	% Recovery	% Bias
Antimony	50	-50
Arsenic	61	-39

Results above the MDL are considered quantitatively uncertain. Results reported for antimony and arsenic in the samples listed above may be biased low.

According to the inorganic SOW, when the pre-digestion spike recovery results for ICP analytes fall outside the 75-125% control limits, a post-digestion spike must be performed for those elements that do not meet the specified criteria. The following post-digestion spike recovery results for sample MY2M84A were obtained.

Analyte	Post-Digestion Spike, % Recovery
Antimony	90
Arsenic	98

Since the post-digestion spike recoveries were acceptable, the low pre-digestion spike recovery results obtained for antimony and arsenic may indicate sample non-homogeneity, poor laboratory technique or matrix effects which may interfere with accurate analysis, depressing the analytical result.

*The matrix spike sample analysis provides information about the effect of the sample matrix on the digestion and measurement methodology.*

- E. The following relative percent differences (RPDs) or absolute differences were obtained for field duplicate pairs listed below.

Analyte	MY2M80 D1 MY2JJ7 D1	Result	MY2M88 D2 MY2MA4 D2	Result
Aluminum	52 RPD	--		
Barium	--	81 RPD		
Calcium	101 RPD	--		
Chromium	51 RPD	--		
Copper	81 RPD	--		
Iron	49 RPD	--		
Lead	4.4 mg/kg difference	--		
Magnesium	1,200 mg/kg difference	--		
Manganese	74 RPD	--		
Zinc	42.5 mg/kg difference	--		

Since sampling variability is included in the measurement, field duplicate results are expected to vary more than laboratory duplicates which have a ▼ 35 RPD or ▼ 2 times CRQL absolute difference criteria for precision. The effect on the quality of the data is not known.

In addition, mercury was detected in the field duplicate sample MY2MA4 at a concentration of 0.47 mg/kg, but was not detected in the associated field duplicate sample MY2M88. An RPD is not calculated. The effect on data quality is not known.

*The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results of the analysis of the field duplicate pair may be due to the sample matrix, high levels of solids in the sample, or poor sampling or laboratory technique.*

**TABLE 1B**  
**DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW**

The definitions of the following qualifiers are prepared in accordance with the document *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, October 2004.

- U     The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- J     The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- J+    The result is an estimated quantity, but the result may be biased high.
- J-    The result is an estimated quantity, but the result may be biased low.
- R     The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.
- UJ    The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

**MEMORANDUM**

**TO:** Matt Mitguard, Site Assessment Manager  
States, Tribes & Site Assessment Section, SFD-9-1

**THROUGH:** Rose Fong, ESAT Task Order Manager (TOM)  
Quality Assurance (QA) Program, MTS-3

**FROM:** Doug Lindelof, Data Review Task Manager  
Region 9 Environmental Services Assistance Team (ESAT)

ESAT Contract No.: EP-W-06-041  
Technical Direction Form No.: 00105013 Amendment 1

**DATE:** September 7, 2006

**SUBJECT:** Review of Analytical Data, Tier 3

Attached are comments resulting from ESAT Region 9 review of the following analytical data:

Site:	Halaco
Site Account No.:	09 X6 LA00
CERCLIS ID No.:	CAD00968805
Case No.:	35429
SDG No.:	MY2MA3
Laboratory:	Bonner Analytical Testing Company (BONNER)
Analysis:	CLP Total Metals
Samples:	16 Sediment and 4 Soil Samples (see Case Summary)
Collection Date:	June 21, 22, 27, and 28, 2006
Reviewer:	Stan Kott, ESAT/Laboratory Data Consultants

This report has been reviewed by the EPA TOM for the ESAT contract, whose signature appears above.

If there are any questions, please contact Rose Fong (QA Program/EPA) at (415) 972-3812.

## Data Validation Report

Case No.: 35429  
SDG No.: MY2MA3  
Site: Halaco  
Laboratory: Bonner Analytical Testing Company (BONNER)  
Reviewer: Stan Kott, ESAT/LDC  
Date: September 7, 2006

### I. CASE SUMMARY

#### Sample Information

Sediment Samples: MY2MA3 through MY2MA9 and MY2MB0 through MY2MB8  
Soil Samples: MY2MB9, MY2MC0, MY2MC1, and MY2MC2  
Concentration and Matrix: Low Concentration Sediment and Soil  
Analysis: CLP Total Metals  
SOW: ILM05.3  
Collection Date: June 21, 22, 27, and 28, 2006  
Sample Receipt Date: July 1, 2006  
Preparation Date: July 7 and 10, 2006  
Analysis Date: July 10 and 11, 2006

#### Field QC

Field Blanks (FB): Not Provided  
Equipment Blanks (EB): Not Provided  
Background Samples (BG): MY2MB1 through MY2MB6  
Field Duplicates (D1): MY2MA4 and MY2M88 (See Additional Comments)  
Field Duplicates (D2): MY2MA7 and MY2MB8  
Field Duplicates (D3): MY2MA8 and MY2MB7  
Field Duplicates (D4): MY2MB9 and MY2JL8 (See Additional Comments)  
Field Duplicates (D5): MY2MC0 and MY2MC2

#### Laboratory QC

Method Blanks & Associated Samples: Preparation Blank- Soil (PBS) and samples listed above

Matrix Spike: MY2MA5S  
Duplicate: MY2MA5D  
ICP Serial Dilution: MY2MA5L

Analysis: CLP Total Metals

<u>Analyte</u>	<u>Sample Preparation and Digestion Date</u>	<u>Analysis Date</u>
ICP-AES Metals	July 7, 2006	July 11, 2006
Mercury	July 10, 2006	July 10, 2006
Percent Solids	July 7, 2006	July 10, 2006

#### CLP PO Action

None.

## Sampling Issues

1. The samples were shipped in a cardboard box without a temperature indicator bottle or ice and arrived at the laboratory with a temperature of 25.5°C. Since the mercury samples arrived at a temperature greater than both the 4°±2 °C SOW limit and the 20.0°C Region 9 maximum temperature limit, results for mercury are estimated "J" or "UJ".
2. The Traffic Report/Chain of Custody (TR/COC) record form did not specify a sample to be used for laboratory quality control (QC). The laboratory selected sample MY2MA5 for QC analysis. The effect on data quality is not known.

## Additional Comments

Results for sample MY2M88, the field duplicate of sample MY2MA4, are included in Case 35429 SDG MY2M69.

Results for sample MY2JL8, the field duplicate of sample MY2MB9, are included in Case 35429 SDG MY2JJ5.

The results for several analytes in background samples MY2MB1 through MY2MB6 exceed the respective contract required quantitation limits (CRQLs). Refer to Table 1A for background sample results.

Sample MY2MB9 was analyzed at a 3-fold dilution for manganese, potassium, sodium, and zinc and a 5-fold dilution for aluminum due to analyte concentrations that exceed the instrument's linear range. No adverse effect on data quality is expected.

All method requirements specified in the EPA Contract Laboratory Program (CLP) Inorganic Statement of Work (SOW), except as noted, have been met.

Analytical results are listed in Table 1A with qualifications. Definitions of data qualifiers used in Table 1A are listed in Table 1B.

This report was prepared in accordance with the following documents:

- ▼ Region 9 Standard Operating Procedure 906, *Guidelines for Data Review of Contract Laboratory Program Analytical Services (CLPAS) Inorganic Data Packages*;
- ▼ USEPA Contract Laboratory Program Statement of Work For Inorganic Analysis Multi-Media, Multi-Concentration ILM05.3, March 2004; and
- ▼ USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004.

## **II. VALIDATION SUMMARY**

The data were evaluated based on the following parameters:

	<u>Parameter</u>	<u>Acceptable</u>	<u>Comment</u>
1.	Data Completeness	Yes	
2.	Sample Preservation and Holding Times	No	B
3.	Calibration	Yes	
a.	Initial		
b.	Initial and Continuing Calibration Verification		
c.	CRQL Check Standard (CRI)		
4.	Blanks	Yes	C
5.	ICP Interference Check Sample (ICS)	Yes	
6.	Laboratory Control Sample (LCS)	Yes	
7.	Duplicate Sample Analysis	Yes	
8.	Matrix Spike Sample Analysis	No	D
9.	ICP Serial Dilution Analysis	No	E
10.	ICP-MS Internal Standards	N/A	
11.	Field Duplicate Sample Analysis	No	F
12.	Sample Quantitation	Yes	A
13.	Overall Assessment	Yes	

N/A = Not Applicable

## **III. VALIDITY AND COMMENTS**

- A. Results above the MDL but below the contract required quantitation limit (CRQL) (denoted with an "L" qualifier) are estimated and flagged "J" in Table 1A.

*Results above the MDL but below the CRQL are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of quantitation.*

- B. The following results are estimated and flagged "J" or "UJ" in Table 1A due to inadequate sample preservation.

- ▼ Mercury in all samples

The samples arrived at the laboratory at a temperature of 25.5°C. Samples did not meet either the 4°±2 °C SOW temperature criterion or the 20.0°C Region 9 maximum temperature criterion. Sample results for mercury may be biased low and, where non-detected, false negatives may exist.

- C. The following results are reported as non-detected (U) in Table 1A due to low level preparation blank and continuing calibration blank (CCB) contamination.

- ▼ Antimony in samples MY2MB2 and MY2MC1
- ▼ Beryllium in samples MY2MA7 through MY2MA9, MY2MB0 through MY2MB8, and MY2MC0 through MY2MC2
- ▼ Sodium in sample MY2MC1

The sodium value (28.6 mg/kg) in preparation blank PBS is greater than the MDL but less than the CRQL. The concentrations for antimony (0.73 mg/kg) and beryllium (0.0057 mg/kg) in CCB3 are greater than the respective MDLs but less than their respective CRQLs. Sample results greater than or equal to the MDL but less than the CRQL are reported as non-detected (U) at the CRQL.

*A preparation blank is an analytical control that contains distilled, deionized water, or baked sand for solid matrices, and reagents, which is carried through the entire analytical procedure. The preparation blank is used to determine the level of contamination introduced by the laboratory during preparation and analysis.*

*A continuing calibration blank (CCB) consists of deionized distilled water and reagents. It is analyzed after the continuing calibration verification (CCV) standard, at a frequency of every 10 samples and at the end of the analytical run to monitor analyte carry-over.*

- D. The following results are estimated and flagged "J" or "UJ" in Table 1A because matrix spike recovery results are outside method QC limits.

▼ Antimony in all samples

Matrix spike recovery results for antimony in QC sample MY2MA5S did not meet the 75-125% criteria for accuracy. The percent recovery and possible percent bias for antimony is presented below and is based on an ideal recovery of 100%.

Analyte	% Recovery	% Bias
Antimony	70	-30

Results above the MDL are considered quantitatively uncertain. Results reported for antimony in all samples may be biased low.

According to the inorganic SOW, when the pre-digestion spike recovery results for ICP analytes fall outside the 75-125% control limits, a post-digestion spike must be performed for those elements that do not meet the specified criteria. The following post-digestion spike recovery result for sample MY2MA5A was obtained.

Analyte	Post-Digestion Spike, % Recovery
Antimony	95

Since the post-digestion spike recovery was acceptable, the low pre-digestion spike recovery result (70.0%) obtained for antimony may indicate sample non-homogeneity, poor laboratory technique or matrix effects which may interfere with accurate analysis, depressing the analytical result.

*The matrix spike sample analysis provides information about the effect of the sample matrix on the digestion and measurement methodology.*

- E. The following results are estimated and flagged "J" or "UJ" in Table 1A because ICP serial dilution results are outside method QC limits.
- ▼ Sodium and zinc in all samples

The percent difference for the ICP serial dilution analysis of sample MY2MA5L did not meet the 10% criterion for the analytes shown below.

Analyte	% Difference
Sodium	+12
Zinc	+42

Results reported for sodium and zinc in all samples are considered quantitatively uncertain. Chemical and physical interferences may exist due to sample matrix effects. The result for the diluted sample was higher than the original. Therefore, the reported sample result may be biased low.

*A five-fold dilution of the laboratory QC sample is performed in association with the ICP procedure to indicate whether interference exists due to sample matrix effects. If the analyte concentration is sufficiently high (minimally a factor of 50 above the MDL in the original sample), the five fold serial dilution must agree within 10% of the original results after correction for dilution.*

- F. The following relative percent differences (RPDs) or absolute differences were obtained for field duplicate pairs listed below.

Analyte	MY2MA4 D1	MY2MA7 D2
	MY2M88 D1	MY2MB8 D2
Aluminum	--	43 RPD
Arsenic	--	2.5 mg/kg difference
Barium	81 RPD	56 RPD
Calcium	--	48 RPD
Iron	--	50 RPD
Lead	--	65 RPD
Manganese	--	43 RPD
Vanadium	--	13.2 mg/kg difference

Analyte	MY2MA8 D3	MY2MB9 D4	MY2MC0 D5
	MY2MB7 D3	MY2JL8 D4	MY2MC2 D5
Arsenic	--	--	2.1 mg/kg, difference
Mercury	0.28 mg/kg, difference	--	--
Vanadium	--	36	--

Since sampling variability is included in the measurement, field duplicate results are expected to vary more than laboratory duplicates which have a ▶ 35 RPD or ▶ 2 times CRQL absolute difference criteria for precision. The effect on the quality of the data is not known.

In addition, mercury was detected in the field duplicate sample MY2MA4 at a concentration of 0.47 mg/kg, but was not detected in the associated field duplicate sample MY2M88. Mercury was also detected in the field duplicate sample MY2MA7 at a concentration of 0.21 mg/kg, but was not detected in the associated field duplicate sample MY2MB8. An RPD is not calculated. The effect on data quality is not known.

*The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results of the analysis of the field duplicate pair may be due to the sample matrix, high levels of solids in the sample, or poor sampling or laboratory technique.*

**TABLE 1B**  
**DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW**

The definitions of the following qualifiers are prepared in accordance with the document *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, October 2004.

- U     The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- J     The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- J+    The result is an estimated quantity, but the result may be biased high.
- J-    The result is an estimated quantity, but the result may be biased low.
- R     The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.
- UJ    The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

## Data Validation Report

Case No.: 35429  
SDG No.: MY2M54  
Site: Halaco  
Laboratory: Bonner Analytical Testing Company (BONNER)  
Reviewer: Stan Kott, ESAT/LDC  
Date: August 29, 2006

### I. CASE SUMMARY

#### Sample Information

Groundwater Samples: MY2M54 through MY2M68  
Surface Water Samples: MY2M90 through MY2M94  
Concentration and Matrix: Low Concentration Water  
Analysis: CLP Total Metals By ICP-AES  
SOW: ILM05.3  
Collection Date: June 27, 28, and 29, 2006  
Sample Receipt Date: July 1, 2006  
Preparation Date: July 6 and 7, 2006  
Analysis Date: July 7 and 10, 2006

#### Field QC

Field Blanks (FB): Not Provided  
Equipment Blanks (EB): Not Provided  
Background Samples (BG): MY2M58 and MY2M67  
Field Duplicates (D1): MY2M60 and MY2M64  
Field Duplicates (D2): MY2M92 and MY2MA0 (See Additional Comments)

#### Laboratory QC

Method Blanks & Associated Samples: Preparation Blank- Water (PBW) and samples listed above  
Matrix Spike: MY2M54S  
Duplicates: MY2M54D  
ICP Serial Dilution: MY2M54L  
Analysis: CLP Total Metals By ICP-AES

<u>Analyte</u>	<u>Sample Preparation and Digestion Date</u>	<u>Analysis Date</u>
ICP-AES Metals	July 6, 2006	July 7 and 10, 2006
Mercury	July 7, 2006	July 7, 2006
Percent Solids	Not Applicable	Not Applicable

#### CLP PO Action

1. Non-detected results reported for antimony, lead, selenium, silver, and thallium in sample MY2M60 and non-detected results reported for antimony, selenium, thallium, and vanadium in sample MY2M62 are rejected (R) and considered unacceptable since the pH of the aqueous samples were greater than 2 at the time of sample receipt.

2. Non-detected results reported for arsenic, selenium, thallium, and vanadium in sample MY2M61 are rejected (R) and considered unacceptable since the pH of the aqueous sample could not be confirmed by the laboratory due to an interfering reaction that rendered the pH strip black.

#### Sampling Issues

1. The Traffic Report/Chain of Custody (TR/COC) record form did not specify a sample to be used for laboratory quality control (QC). The laboratory selected sample MY2M54 for QC analysis. The effect on data quality is not known.
2. The cooler containing samples MY2M54, MY2M58, MY2M59, MY2M63, MY2M64, MY2M66, MY2M67, and MY2M68 arrived at the laboratory with a temperature of 14°C. The cooler containing samples MY2M55, MY2M56, MY2M57, MY2M65, MY2M90, and MY2M93 arrived at the laboratory with a temperature of 11°C. This temperature exceeds the temperature of 4°±2°C specified in the Statement of Work (SOW). Since the water samples were preserved to a pH less than 2, no adverse effect on the quality of the data is expected.

#### Additional Comments

Results for sample MY2MA0, the field duplicate of sample MY2M92, are included in Case 35429 SDG MY2M95.

The results for several analytes in background samples MY2M58 and MY2M67 exceed the respective contract required quantitation limits (CRQLs). Refer to Table 1A for background sample results.

All samples were analyzed between 4 to 250-fold dilutions due to several analyte concentrations that exceed the instrument's linear range. No adverse effect on data quality is expected.

All method requirements specified in the EPA Contract Laboratory Program (CLP) Inorganic Statement of Work (SOW), except as noted, have been met.

Analytical results are listed in Table 1A with qualifications. Definitions of data qualifiers used in Table 1A are listed in Table 1B.

This report was prepared in accordance with the following documents:

- ▼ Region 9 Standard Operating Procedure 906, *Guidelines for Data Review of Contract Laboratory Program Analytical Services (CLPAS) Inorganic Data Packages*;
- ▼ USEPA Contract Laboratory Program Statement of Work For Inorganic Analysis Multi-Media, Multi-Concentration ILM05.3, March 2004; and
- ▼ USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004.

## **II. VALIDATION SUMMARY**

The data were evaluated based on the following parameters:

	<u>Parameter</u>	<u>Acceptable</u>	<u>Comment</u>
1.	Data Completeness	Yes	
2.	Sample Preservation and Holding Times	No	A,C
3.	Calibration	Yes	
	a. Initial		
	b. Initial and Continuing Calibration Verification		
	c. CRQL Check Standard (CRI)		
4.	Blanks	Yes	D
5.	ICP Interference Check Sample (ICS)	Yes	
6.	Laboratory Control Sample (LCS)	Yes	
7.	Duplicate Sample Analysis	Yes	
8.	Matrix Spike Sample Analysis	No	E
9.	ICP Serial Dilution Analysis	No	F
10.	ICP-MS Internal Standards	N/A	
11.	Field Duplicate Sample Analysis	No	G
12.	Sample Quantitation	Yes	B
13.	Overall Assessment	Yes	

N/A = Not Applicable

## **III. VALIDITY AND COMMENTS**

- A. The following results are rejected and flagged "R" in Table 1A due to inadequate sample preservation.
- ▼ Antimony in samples MY2M60 and MY2M62
  - ▼ Arsenic in sample MY2M61
  - ▼ Lead in sample MY2M60
  - ▼ Selenium and thallium in samples MY2M60, MY2M61, and MY2M62
  - ▼ Silver in sample MY2M60
  - ▼ Vanadium in sample MY2M61

These samples did not meet SOW sample preservation criterion. The samples were not adequately preserved in the field to a pH of less than 2 as shown below.

Sample Number	pH
MY2M60	4
MY2M61	Unknown
MY2M62	7

Note that the laboratory could not confirm the pH of sample MY2M61 due to an interfering reaction that rendered the pH strip black.

- B. For non-detected sample results, false negatives may exist.
- B. Results above the method detection limit (MDL) but below the contract required quantitation limit (CRQL) (denoted with an "L" qualifier) are estimated and flagged "J" in Table 1A.

*Results above the MDL but below the CRQL are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of quantitation.*

- C. The following results are estimated and flagged "J" or "J-" in Table 1A due to inadequate sample preservation.
- ▼ All analytes in sample MY2M60 except antimony, lead, selenium, silver, and thallium
  - ▼ All analytes in sample MY2M61 except arsenic, selenium, thallium, and vanadium
  - ▼ All analytes in sample MY2M62 except antimony, selenium, and thallium

These samples did not meet SOW sample preservation criterion. The samples were not adequately preserved in the field to a pH of less than 2 as shown below.

Sample Number	pH
MY2M60	4
MY2M61	Unknown
MY2M62	7

Note that the laboratory could not confirm the pH of sample MY2M61 due to an interfering reaction that rendered the pH strip black.

Sample results may be biased low.

Note that sample results for antimony, arsenic, lead, selenium, silver, thallium, and vanadium in the respective samples listed above were previously rejected. Please refer to Comment A.

- D. The following results are reported as non-detected (U) in Table 1A due to low level preparation blank and continuing calibration blank (CCB) contamination.
- ▼ Aluminum in samples MY2M91, MY2M93, and MY2M94
  - ▼ Arsenic in samples MY2M65, MY2M68, MY2M90, and MY2M91
  - ▼ Barium in samples MY2M57, MY2M59, MY2M66, MY2M67, MY2M90 through MY2M94
  - ▼ Beryllium in samples MY2M64 through MY2M68, MY2M90, MY2M92, MY2M93, and MY2M94
  - ▼ Cadmium in samples MY2M91 and MY2M92
  - ▼ Nickel in samples MY2M91 through MY2M94
  - ▼ Zinc in samples MY2M56, MY2M59, MY2M63, MY2M66, MY2M67, MY2M68, and MY2M90 through MY2M94

The concentration for zinc ( $2.4 \mu\text{g/L}$ ) in preparation blank PBW is greater than the MDL but less than the CRQL. The values for aluminum ( $25.7 \mu\text{g/L}$  in CCB6 and  $33.0 \mu\text{g/L}$  in CCB8), arsenic ( $25.7 \mu\text{g/L}$  in CCB7), barium ( $2.1 \mu\text{g/L}$  in CCB6 and  $2.1 \mu\text{g/L}$  in CCB8), beryllium ( $0.046 \mu\text{g/L}$  in CCB7 and  $0.063 \mu\text{g/L}$  in CCB8), cadmium ( $0.35 \mu\text{g/L}$  in CCB8), and nickel ( $0.92 \mu\text{g/L}$  in CCB8) are greater than the respective MDLs but less than the respective CRQLs. Sample results greater than or equal to the MDL but less than the CRQL are reported as non-detected (U) at the respective CRQL.

*A preparation blank is an analytical control that contains distilled, deionized water, or baked sand for solid matrices, and reagents, which is carried through the entire analytical procedure. The preparation blank is used to determine the level of contamination introduced by the laboratory during preparation and analysis.*

*A continuing calibration blank (CCB) consists of deionized, distilled water and reagents. It is analyzed after the continuing calibration verification (CCV) standard, at a frequency of every 10 samples and at the end of the analytical run to monitor analyte carry-over.*

- E. The following results are estimated and flagged "J" in Table 1A because a matrix spike recovery result is outside method QC limits.

- ▼ Silver in samples MY2M55, MY2M61, and MY2M62

Matrix spike recovery for silver in QC sample MY2M54S did not meet the 75-125% criteria for accuracy. The percent recovery and possible percent bias for silver is presented below and based on an ideal recovery of 100%.

Analyte	% Recovery	% Bias
Silver	262	+162

Results above the MDL are considered quantitatively uncertain. Results reported for silver in the samples listed above may be biased high.

According to the inorganic SOW, when the pre-digestion spike recovery results for ICP analytes (except silver) fall outside the control limits of 75-125%, a post-digestion spike must be performed for those elements that do not meet the specified criteria. The following post-digestion spike recovery result for sample MY2M54A was obtained.

Analyte	Post-Digestion Spike, % Recovery
Silver	61

Since both the post- and pre-digestion spikes did not meet the QC criteria, matrix effects may be present in the sample digestate which may interfere with accurate analysis.

*The matrix spike sample analysis provides information about the effect of the sample matrix on the digestion and measurement methodology.*

- F. The following results are estimated and flagged "J" or "UJ" in Table 1A because an ICP serial dilution result is outside method QC limits.

- ▼ Zinc in all samples

The percent difference for the ICP serial dilution analysis of sample MY2M54L did not meet the 10% criterion for zinc as shown below.

Analyte	% Difference
Zinc	+15

Results reported for zinc in all samples are considered quantitatively uncertain. Chemical and physical interferences may exist due to sample matrix effects. The result for the diluted sample was higher than the original. Therefore, the reported sample result may be biased low.

*A five-fold dilution of the laboratory QC sample is performed in association with the ICP procedure to indicate whether interference exists due to sample matrix effects. If the analyte concentration is sufficiently high (minimally a factor of 50 above the MDL in the original sample), the five fold serial dilution must agree within 10% of the original results after correction for dilution.*

- G. The following relative percent differences (RPDs) or absolute differences were obtained for field duplicate pairs listed below.

Analyte	MY2M60 D1	MY2M92 D2
	MY2M64 D1	MY2MA0 D2
Aluminum	49	379 µg/L difference
Arsenic	17.3 µg/L difference	--
Calcium	21	--
Copper	50	--
Iron	30	--
Manganese	--	58
Potassium	--	41
Zinc	72.0 µg/L difference	--

Since sampling variability is included in the measurement, field duplicate results are expected to vary more than laboratory duplicates which have a ▼20 RPD or ▼CRQL criteria for precision. The effect on the quality of the data is not known.

*The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results of the analysis of the field duplicate pair may be due to the sample matrix, high levels of solids in the sample, or poor sampling or laboratory technique.*

**TABLE 1B**  
**DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW**

The definitions of the following qualifiers are prepared in accordance with the document *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, October 2004.

- U     The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- J     The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- J+    The result is an estimated quantity, but the result may be biased high.
- J-    The result is an estimated quantity, but the result may be biased low.
- R     The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.
- UJ    The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Technical Direction Form No.: 00105013 Amendment 1

**DATE:** August 23, 2006

**SUBJECT:** Review of Analytical Data, Tier 3

Attached are comments resulting from ESAT Region 9 review of the following analytical data:

Site:	Halaco
Site Account No.:	09 X6 LA00
CERCLIS ID No.:	CAD00968805
Case No.:	35429
SDG No.:	MY2M95
Laboratory:	Bonner Analytical Testing Company (BONNER)
Analysis:	CLP Total Metals
Samples:	6 Water Samples (see Case Summary)
Collection Date:	June 28 and 29, 2006
Reviewer:	Stan Kott, ESAT/Laboratory Data Consultants

This report has been reviewed by the EPA TOM for the ESAT contract, whose signature appears above.

If there are any questions, please contact Rose Fong (QA Program/EPA) at (415) 972-3812.

## Data Validation Report

Case No.: 35429  
SDG No.: MY2M95  
Site: Halaco  
Laboratory: Bonner Analytical Testing Company (BONNER)  
Reviewer: Stan Kott, ESAT/LDC  
Date: August 23, 2006

### I. CASE SUMMARY

#### Sample Information

Samples: MY2M95, MY2M96, MY2M97, MY2M98, MY2M99, and MY2MA0  
Concentration and Matrix: Low Concentration Water  
Analysis: CLP Total Metals  
SOW: ILM05.3  
Collection Date: June 28 and 29, 2006  
Sample Receipt Date: July 1, 2006  
Preparation Date: July 5 and 7, 2006  
Analysis Date: July 6 and 7, 2006

#### Field QC

Field Blanks (FB): Not Provided  
Equipment Blanks (EB): Not Provided  
Background Samples (BG): MY2M96, MY2M97, MY2M98, and MY2M99  
Field Duplicates (D1): MY2MA0 and MY2M92 (See Additional Comments)

#### Laboratory QC

Method Blanks & Associated Samples: Preparation Blank- Water (PBW) and samples listed above

Matrix Spike: MY2M95S  
Duplicates: MY2M95D  
ICP Serial Dilution: MY2M95L

Analysis: CLP Total Metals

<u>Analyte</u>	<u>Sample Preparation and Digestion Date</u>	<u>Analysis Date</u>
ICP-AES Metals	July 5, 2006	July 6 and 7, 2006
Mercury	July 7, 2006	July 7, 2006
Percent Solids	Not Applicable	Not Applicable

#### CLP PO Action

None.

## Sampling Issues

1. The cooler containing samples MY2M98 arrived at the laboratory with a temperature of 11°C. This temperature exceeds the temperature of 4°±2°C specified in the Statement of Work (SOW). Since the water samples were preserved to a pH less than 2, no adverse effect on the quality of the data is expected.
2. The Traffic Report/Chain of Custody (TR/COC) record form did not specify a sample to be used for laboratory quality control (QC). The laboratory selected sample MY2M95 for laboratory QC analysis. The effect on data quality is not known.

## Additional Comments

Several forms in the data package require correction. The corrected forms were requested from the laboratory but have not been received to date. Data quality is not likely to be affected and this report is considered final. (See attached TRL.)

The results for sample MY2M92, the field duplicate of sample MY2MA0, are included in Case 35429 SDG MY2M54.

All samples were analyzed between 10 to 40-fold dilutions due to sodium concentrations that exceed the instrument's linear range. Sample MY2MA0 was analyzed at a 3-fold dilution due to a potassium concentration that exceeds the instrument's linear range. No adverse effect on data quality is expected.

All method requirements specified in the EPA Contract Laboratory Program (CLP) Inorganic Statement of Work (SOW), except as noted, have been met.

Analytical results are listed in Table 1A with qualifications. Definitions of data qualifiers used in Table 1A are listed in Table 1B.

This report was prepared in accordance with the following documents:

- ▼ Region 9 Standard Operating Procedure 906, *Guidelines for Data Review of Contract Laboratory Program Analytical Services (CLPAS) Inorganic Data Packages*;
- ▼ USEPA Contract Laboratory Program Statement of Work For Inorganic Analysis Multi-Media, Multi-Concentration ILM05.3, March 2004; and
- ▼ USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004.

## II. VALIDATION SUMMARY

The data were evaluated based on the following parameters:

	<u>Parameter</u>	<u>Acceptable</u>	<u>Comment</u>
1.	Data Completeness	Yes	
2.	Sample Preservation and Holding Times	Yes	
3.	Calibration	Yes	
a.	Initial		
b.	Initial and Continuing Calibration Verification		
c.	CRQL Check Standard (CRI)		
4.	Blanks	Yes	B
5.	ICP Interference Check Sample (ICS)	Yes	
6.	Laboratory Control Sample (LCS)	Yes	
7.	Duplicate Sample Analysis	Yes	
8.	Matrix Spike Sample Analysis	Yes	
9.	ICP Serial Dilution Analysis	No	C
10.	ICP-MS Internal Standards	N/A	
11.	Field Duplicate Sample Analysis	No	D
12.	Sample Quantitation	Yes	A
13.	Overall Assessment	Yes	

N/A = Not Applicable

## III. VALIDITY AND COMMENTS

- A. Results above the method detection limit (MDL) but below the contract required quantitation limit (CRQL) (denoted with an "L" qualifier) are estimated and flagged "J" in Table 1A.

*Results above the MDL but below the CRQL are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of quantitation.*

- B. The following results are reported as non-detected (U) in Table 1A due to low level preparation blank contamination.

- ▼ Arsenic in samples MY2M95, MY2M96, MY2M98, MY2M99, and MY2MA0

The arsenic (8.6 µg/L) concentration in preparation blank PBW is greater than the MDL but less than the CRQL. Sample results greater than or equal to the MDL but less than the CRQL are reported as non-detected (U) at the CRQL.

*A preparation blank is an analytical control that contains distilled, deionized water, or baked sand for solid matrices, and reagents, which is carried through the entire analytical procedure. The preparation blank is used to determine the level of contamination introduced by the laboratory during preparation and analysis.*

- C. The following results are estimated and flagged "J" in Table 1A because an ICP serial dilution result is outside method QC limits.

▼ Potassium in all samples

The percent difference for the ICP serial dilution analysis of sample MY2M95L did not meet the 10% criterion for potassium as shown below.

Analyte	% Difference
Potassium	-13

Results reported for potassium in all samples are considered quantitatively uncertain. Chemical and physical interferences may exist due to sample matrix effects. The result for the diluted sample was lower than the original. Therefore, the reported sample results for potassium may be biased high.

*A five-fold dilution of the laboratory QC sample is performed in association with the ICP procedure to indicate whether interference exists due to sample matrix effects. If the analyte concentration is sufficiently high (minimally a factor of 50 above the MDL in the original sample), the five fold serial dilution must agree within 10% of the original results after correction for dilution.*

- D. The following relative percent differences (RPDs) and absolute difference were obtained for field duplicate pair MY2MA0 and MY2M92 listed below.

Analyte	RPD	Absolute Difference, µg/L
Aluminum	--	379
Manganese	+58	--
Potassium	+41	--

Since sampling variability is included in the measurement, field duplicate results are expected to vary more than laboratory duplicates which have a ▼20 RPD or ▼CRQL criteria for precision. The absolute difference for aluminum exceeds the 200 µg/L CRQL control limit. The effect on the quality of the data is not known.

*The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results of the analysis of the field duplicate pair may be due to the sample matrix, high levels of solids in the sample, or poor sampling or laboratory technique.*

**TABLE 1B**  
**DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW**

The definitions of the following qualifiers are prepared in accordance with the document *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, October 2004.

- U     The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
- J     The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- J+    The result is an estimated quantity, but the result may be biased high.
- J-    The result is an estimated quantity, but the result may be biased low.
- R     The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.
- UJ    The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Summary of Questions/issues Discussed:

The following items were noted during the review of this sample delivery group (SDG) data package. Please respond within 4 days as specified in ILM05.3 Statement of Work (SOW), Exhibit B, Section 2, 2.2. Send response and resubmissions to

ICF International/Laboratory Data Consultants, Inc.,  
Environmental Services Assistance Team, USEPA Region 9 Laboratory  
1337 S. 46th Street, Building 201, Richmond, CA 94804, FAX 510 412-2304.

1. Forms 2A (Initial and Continuing Calibration Verification), 2B (CRQL Check Standard), 3 (Blanks), and 4A (ICP-AES Interference Check Sample) do not conform to the chronological reporting format specified in the SOW. Please review ILM05.3, Exhibit B, Section 3, parts 3.4.3.2.11 (ICV/CCV); 3.4.4.2.9 (CRI); 3.4.5.2.11 (Blank); and 3.4.6.2.15 (ICS) for the required format and provide corrected forms.
2. Form 9 (MDLs) (pages 34 and 35) require MDLs be reported with two significant figures. Please review ILM05.3, Exhibit B, Section 3, part 3.4.12.2.8 for the required format and provide corrected pages.

Summary of Resolution: To be determined.

## Data Validation Report

Case No.: 35429  
SDG No.: Y2M54  
Site: Halaco  
Laboratory: KAP Technologies, Inc  
Reviewer: Dennis Mayugba, ESAT/LDC  
Date: August 17, 2006

### I. CASE SUMMARY

#### Sample Information

Samples: Y2M54 through Y2M68 and Y2M91 through Y2M95  
Concentration and Matrix: Trace Concentration Water  
Analysis: Trace Volatiles  
SOW: SOM01.1  
Collection Date: June 27 through 29, 2006  
Sample Receipt Date: July 1, 2006  
Extraction Date: Not Applicable  
Analysis Date: July 7, 8, 11, 13, and 14, 2006

#### Field QC

Field Blanks (FB): Not Provided  
Equipment Blanks (EB): Not Provided  
Trip Blanks (TB): Not Provided  
Background Samples (BG): Y2M58 and Y2M67  
Field Duplicates (D1): Y2M60 and Y2M64  
Field Duplicates (D2): Y2M92 and Y2MA0 (in SDG Y2M90)

#### Laboratory QC

##### Method Blanks & Associated Samples:

VBLK15: Y2M54 through Y2M60, Y2M63, and Y2M65  
VBLK17: Y2M61, Y2M55DL, Y2M61DL, Y2M62, Y2M64,  
Y2M66, Y2M68, and Y2M91 through Y2M93  
VBLK22: Y2M94, Y2M95, Y2M56MS, and Y2M56MSD  
VBLK74: Y2M67  
VBLK76: Storage blank VHBLK01

#### Tables

- 1A: Analytical Results with Qualifications
- 1B: Data Qualifier Definitions for Organic Data Review
- 2: Calibration Summary

#### CLP PO Action

Nondetected results for 1,4-dioxane in all samples, all method blanks, and storage blank VHBLK01 are qualified as rejected (R) due to very low relative response factors (<0.01) in the initial and continuing calibrations (see Comment A).

### CLP PO Attention

1. Results for all analytes in sample Y2M67 are qualified as estimated (J) due to a holding time problem (see Comment B).
2. Results for acetone in all samples, all method blanks, and storage blank VHBLK01 are qualified as estimated (J) due to low relative response factors (see Comment C).
3. Results for some analytes are qualified as estimated (J) due to deuterated monitoring compound (DMC) recovery problems (see Comment D).
4. Results for some analytes in sample Y2M60 are qualified as estimated (J) due to an internal standard (IS) area problem (see Comment E)

### Sampling Issues

None.

### Additional Comments

Acetone was detected in background sample Y2M58 at a concentration of 8.1 ▪g/L. No target analytes were detected in background sample Y2M67.

Other than laboratory artifacts (approximate retention times of 2.5, 4.3, 4.8, 7.2, 7.7, 10.3, 10.7, and 15.8 minutes), tentatively identified compounds (TICs) were found in samples Y2M55, Y2M60, Y2M61, Y2M64, and Y2M65 (see attached Form 1Js).

The laboratory performed manual integrations on calibrations and samples due to incorrect auto integration. Manual integrations were reviewed and found to be satisfactory and in compliance with proper integration techniques.

This report was prepared in accordance with the following documents:

- ▼ ESAT Region 9 Standard Operating Procedure 901, *Guidelines for Data Review of Contract Laboratory Program Analytical Services Volatile and Semivolatile Data Packages*;
- ▼ USEPA *Contract Laboratory Program Statement of Work for Organics Analysis, Multi-Media, Multi-Concentration*, SOM01.1, May 2005; and
- ▼ USEPA *Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review*, January 2005.

## **II. VALIDATION SUMMARY**

The data were evaluated based on the following parameters:

<u>Parameter</u>	<u>Acceptable</u>	<u>Comment</u>
1. Holding Time/Preservation	No	B
2. GC/MS Tune/GC Performance	Yes	
3. Initial Calibration	No	A, C
4. Continuing Calibration	No	A, C
5. Laboratory Blanks	Yes	
6. Field Blanks	N/A	
7. Deuterated Monitoring Compounds	No	D
8. Matrix Spike/Matrix Spike Duplicates	No	G
9. Laboratory Control Samples/Duplicates	N/A	
10. Internal Standards	No	E
11. Compound Identification	Yes	
12. Compound Quantitation	Yes	H
13. System Performance	Yes	
14. Field Duplicate Sample Analysis	No	F

N/A = Not Applicable

## **III. VALIDITY AND COMMENTS**

- A. Nondetected results for the following analyte are qualified as rejected due to very low relative response factors (RRFs) in the initial and continuing calibrations and are flagged "R" in Table 1A.

- ▼ 1,4-Dioxane in all samples, all method blanks, and storage blank VHBLK01

Relative response factors (RRFs) below the 0.01 were reported for 1,4-dioxane in the initial and continuing calibrations (see Table 2). Since results are nondetected, false negatives may exist.

The DMC 1,4-dioxane-d8 also had RRFs below 0.01 in the initial and continuing calibrations and the DMC hexanone-d5 had an RRF below 0.01 in the 07/08/06 continuing calibration (see Table 2).

*The RRF evaluates instrument sensitivity and is used in the quantitation of target analytes.*

- B. Results for the following analytes are qualified as estimated due to a missed technical holding time and are flagged AJ@ in Table 1A.

- ▼ All analytes in sample Y2M67

This water analysis exceeded the 14-day 40 CFR 136 (Clean Water Act) technical holding time for preserved water samples as shown below. The SDG Narrative did not provide an explanation.

<u>Sample</u>	<u>Date Collected</u>	<u>Date Analyzed</u>	<u># of Days Exceeded</u>
Y2M67	06/27/06	07/13/06	2

Detected results for the samples listed above may be biased low. Where results are nondetected, false negatives may exist.

- C. Results for the following analyte are qualified as estimated due to low relative response factors (RRFs) in initial and continuing calibrations and are flagged "J" in Table 1A.

- ▼ Acetone in all samples, all method blanks, and storage blank VHBLK01

RRFs were below the 0.05 validation criterion for acetone in the initial and continuing calibrations (see Table 2).

Detected results for acetone should be considered as the minimum concentrations at which this analyte is present in the samples. Where results are nondetected, false negatives may exist.

DMCs 2-butanone-d5 and 2-hexanone-d5 also had RRFs below the 0.05 validation criterion in the initial and continuing calibrations (see Table 2). Quantitation of the analytes associated with these DMCs may have been affected by the low RRFs (see attached Table 9 from the Functional Guidelines).

*The RRF evaluates instrument sensitivity and is used in the quantitation of target analytes.*

- D. Results for the following analytes are qualified as estimated due to DMC recoveries outside QC limits and are flagged AJ@ in Table 1A.

{Chloroethane-d5}

- ▼ Dichlorodifluoromethane, chloromethane, bromomethane, chloroethane, and carbon disulfide in sample Y2M68

{1,1-Dichloroethene-d2}

- ▼ trans-1,2-Dichloroethene and cis-1,2-dichloroethene in sample Y2M61

DMC recoveries outside QC limits are shown below.

<u>Sample</u>	<u>DMC</u>	<u>% Recovery</u>	<u>QC Limits</u>
Y2M68	Chloroethane-d5	37	71-131
Y2M61	1,1-Dichloroethene-d2	54	55-104
Y2M54	1,2-Dichloroethane-d4	130	78-129
Y2M55	1,2-Dichloroethane-d4	130	78-129
Y2M58	1,2-Dichloroethane-d4	133	78-129
Y2M60	1,2-Dichloroethane-d4	131	78-129
Y2M66	1,2-Dichloroethane-d4	133	78-129

<u>Sample</u>	<u>DMC</u>	<u>% Recovery</u>	<u>QC Limits</u>
Y2M94	1,2-Dichloroethane-d4	137	78-129
Y2M55DL	1,2-Dichloroethane-d4	136	78-129
Y2M61DL	1,2-Dichloroethane-d4	139	78-129
Y2M56MS	trans-1,3-Dichloropropene-d4	67	73-121
Y2M56MSD	trans-1,3-Dichloropropene-d4	72	73-121
Y2M55	2-Hexanone-d5	145	28-135
Y2M62	2-Hexanone-d5	152	28-135
Y2M55	1,4-Dioxane-d8	202	50-150
Y2M60	1,4-Dioxane-d8	158	50-150
Y2M63	1,4-Dioxane-d8	166	50-150
Y2M55DL	1,4-Dioxane-d8	158	50-150
Y2M61DL	1,4-Dioxane-d8	153	50-150
Y2M61	1,4-Dioxane-d8	152	50-150
Y2M55	1,1,2,2-Tetrachloroethane-d2	133	73-125
Y2M60	1,1,2,2-Tetrachloroethane-d2	128	73-125
Y2M55DL	1,1,2,2-Tetrachloroethane-d2	126	73-125

Since results are nondetected, false negatives may exist. Detected results for affected analytes where DMC recoveries exceeded QC limits may be biased high. For DMC recoveries that exceeded QC limits, only detected results for associated analytes are qualified. Recoveries for DMCs 1,2-dichloroethane-d4, 2-hexanone-d5, 1,4-dioxane-d8, and 1,1,2,2-tetrachloroethane-d2 exceeded QC limits but results were not qualified because they were nondetects. The samples were not reanalyzed.

*Surrogates (e.g., deuterated monitoring compounds (DMCs)) are organic compounds which are similar to the target analytes in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. All samples are spiked with DMCs prior to purging. DMCs provide information about both the laboratory performance on individual samples and the possible effects of the sample matrix on the analytical results.*

- E. Results for the following analytes are qualified as estimated due to a high internal standard (IS) area and are flagged **AJ@** in Table 1A.

{Chlorobenzene-d5}

- ▼ 1,1,1-Trichloroethane, cyclohexane, carbon tetrachloride, benzene, trichloroethene, methylcyclohexane, 1,2-dichloropropane, bromodichloromethane, cis-1,3-dichloropropane, 4-methyl-2-pentanone, toluene, trans-1,3-dichloropropene, 1,1,2-trichloroethane, tetrachloroethene, 2-hexanone, dibromochloromethane, 1,2-dibromoethane, chlorobenzene, ethylbenzene, xylenes (total), styrene, isopropylbenzene, and 1,1,2,2-tetrachloroethane in sample Y2M60

The IS area outside QC limit is shown below.

<u>Sample</u>	<u>Internal Standard</u>	<u>Area</u>	<u>QC Limits</u>
Y2M60	Chlorobenzene-d5	13270322	5561732-12977375

Results for the affected analytes are considered quantitatively questionable. Where results are nondetected, false negatives may exist. The sample was not reanalyzed.

*Internal standards, introduced into every calibration standard, blank, sample, and QC sample, monitor changes in analyte response due to matrix effects and fluctuations in instrument sensitivity throughout the analytical sequence. Internal standards are used to quantitate the concentration of target analytes and surrogate standards.*

F. In the analysis of the field duplicate pairs, the following outliers were reported.

<u>Analyte</u>	Y2M60 (D1)	Y2M64 (D1)	<u>RPD (&lt;25%)</u>
	<u>Conc., ▾g/L</u>	<u>Conc., ▾g/L</u>	
Acetone	5.0U	40	N/A
<u>Analyte</u>	Y2MA0 (D2)	Y2M92 (D2)	<u>RPD (&lt;25%)</u>
	<u>Conc., µg/L</u>	<u>Conc., µg/L</u>	
Acetone	5.3	5.0U	N/A

The effect on data quality is not known.

*The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results of the analysis of the field duplicate pair may be due to the sample matrix or poor sampling or laboratory technique.*

G. Matrix spike and matrix spike duplicate recoveries for trichloroethene (TCE), benzene, and chlorobenzene in QC samples Y2M56MS and Y2M56MSD did not meet the criteria for accuracy specified in the SOW, as shown below.

<u>Analyte</u>	<u>Y2M56MS % Recovery</u>	<u>Y2M56MSD % Recovery</u>	<u>QC limits % Recovery</u>
Trichloroethene	52	52	71-120
Benzene	74	74	76-127
Chlorobenzene	70	72	75-130

Results obtained may indicate poor laboratory technique or matrix effects which may interfere with analysis. Since TCE, benzene, and chlorobenzene results in sample Y2M56 are nondetected, false negatives may exist. The effect on data quality for other samples is not known.

*Matrix spike sample analysis provides information about the effect of the sample matrix on sample preparation and measurement.*

- H. Samples Y2M55 and Y2M61 were analyzed at 2-fold and 10-fold dilutions, respectively, due to high levels of acetone that exceeded the calibration range. Results for acetone in samples Y2M55 and Y2M61 are reported from the diluted analyses in Table 1A; results for other analytes are reported from the undiluted analyses.

**TABLE 1B**  
**DATA QUALIFIER DEFINITIONS FOR ORGANIC DATA REVIEW**

The definitions of the following qualifiers are prepared according to the document, "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," January 2005.

- U     The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.
- L     Indicates results which fall below the Contract Required Quantitation Limit. Results are estimated and are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.
- J     The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).
- NJ    The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ    The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.
- R     The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

## Data Validation Report

Case No.: 35429  
SDG No.: Y2M90  
Site: Halaco  
Laboratory: KAP Technologies, Inc  
Reviewer: April Martinez, ESAT/LDC  
Date: August 14, 2006

### I. CASE SUMMARY

#### Sample Information

Samples: Y2M90, Y2M96 through Y2M99, and Y2MA0  
Concentration and Matrix: Trace Concentration Water  
Analysis: Volatiles  
SOW: SOM01.1  
Collection Date: June 27 and 28, 2006  
Sample Receipt Date: July 1, 2006  
Extraction Date: Not Applicable  
Analysis Date: July 11 and 12, 2006

#### Field QC

Field Blanks (FB): Not Provided  
Equipment Blanks (EB): Not Provided  
Trip Blanks (TB): Not Provided  
Background Samples (BG): Y2M96, Y2M97, Y2M98, and Y2M99  
Field Duplicates (D1): Y2MA0 and Y2M92 (in SDG Y2M54)

#### Laboratory QC

##### Method Blanks & Associated Samples:

VBLK22: Y2M90, Y2M96 through Y2M99, Y2MA0,  
Y2M90MS, and Y2M90MSD  
VBLK71: storage blank VHBLK01

#### Tables

- 1A: Analytical Results with Qualifications
- 1B: Data Qualifier Definitions for Organic Data Review
- 2: Calibration Summary

#### CLP PO Action

Nondetected results for 1,4-dioxane in all samples, all method blanks, and storage blank VHBLK01 are qualified as rejected (R) due to very low response factors (<0.01) in the initial and continuing calibrations (see Comment A).

#### CLP PO Attention

1. Results for acetone in all samples, all method blanks, and storage blank VHBLK01 are qualified as estimated (J) due to calibration problems (see Comment B).

2. The result for methyl tert-butyl ether in sample Y2M99 is qualified as estimated (J) due to a deuterated monitoring compound (DMC) recovery problem (see Comment C).

#### Sampling Issues

None.

#### Additional Comments

Acetone was detected in background samples Y2M96, Y2M97, Y2M98, and Y2M99 at concentrations of 5.4  $\mu\text{g/L}$ , 8.0  $\mu\text{g/L}$ , 7.8  $\mu\text{g/L}$ , and 8.2  $\mu\text{g/L}$ , respectively. Methyl tert-butyl ether was detected in background sample Y2M99 at a concentration of 0.51  $\mu\text{g/L}$ .

Other than laboratory artifacts (approximate retention times of 2.5, 7.2, and 10.7 minutes), tentatively identified compounds (TICs) were not found in the samples.

The laboratory performed manual integrations on calibrations due to incorrect auto integration. Manual integrations were reviewed and found to be satisfactory and in compliance with proper integration techniques.

This report was prepared in accordance with the following documents:

- ▼ ESAT Region 9 Standard Operating Procedure 901, *Guidelines for Data Review of Contract Laboratory Program Analytical Services Volatile and Semivolatile Data Packages*;
- ▼ USEPA *Contract Laboratory Program Statement of Work for Organics Analysis, Multi-Media, Multi-Concentration*, SOM01.1, May 2005; and
- ▼ USEPA *Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review*, January 2005.

## **II. VALIDATION SUMMARY**

The data were evaluated based on the following parameters:

<u>Parameter</u>	<u>Acceptable</u>	<u>Comment</u>
1. Holding Time/Preservation	Yes	
2. GC/MS Tune/GC Performance	Yes	
3. Initial Calibration	No	A, B
4. Continuing Calibration	No	A, B
5. Laboratory Blanks	Yes	
6. Field Blanks	N/A	
7. Deuterated Monitoring Compounds	No	C
8. Matrix Spike/Matrix Spike Duplicates	No	D
9. Laboratory Control Samples/Duplicates	N/A	
10. Internal Standards	Yes	
11. Compound Identification	Yes	
12. Compound Quantitation	Yes	
13. System Performance	Yes	
14. Field Duplicate Sample Analysis	No	E

N/A = Not Applicable

## **III. VALIDITY AND COMMENTS**

- A. Nondetected results for the following analyte are qualified as rejected due to very low relative response factors (RRFs) in initial and continuing calibrations and are flagged "R" in Table 1A.

- ▼ 1,4-Dioxane in all samples, all method blanks, and storage blank VHBLK01

Relative response factors (RRFs) below the 0.01 were observed for the analyte listed above in the initial and continuing calibrations (see Table 2). Since results are nondetected, false negatives may exist.

The DMC 1,4-dioxane-d8 also had RRFs below 0.01 in the initial and continuing calibrations (see Table 2).

*The RRF evaluates instrument sensitivity and is used in the quantitation of target analytes.*

- B. Results for the following analyte are qualified as estimated due to low relative response factors (RRFs) in initial and continuing calibrations and are flagged "J" in Table 1A.

- ▼ Acetone in all samples, all method blanks, and storage blank VHBLK01

RRFs were below the 0.05 validation criterion for acetone in the initial and continuing calibrations (see Table 2).

Detected results for acetone should be considered as the minimum concentrations at which this analyte is present in the samples. Where results are nondetected, false negatives may exist.

DMCs 2-butanone-d5 and 2-hexanone-d5 also had RRFs below the 0.05 validation criterion in the initial calibration and continuing calibrations (see Table 2).

Quantitation of the analytes associated with these DMCs may have been affected by the low RRFs (see attached Table 9 from the Functional Guidelines).

*The RRF evaluates instrument sensitivity and is used in the quantitation of target analytes.*

- C. The result for the following analyte is qualified as estimated due to a DMC recovery outside QC limits and is flagged AJ@ in Table 1A.

{1,2-Dichloroethane-d4}  
▼ Methyl tert-butyl ether in sample Y2M99

DMC recoveries outside QC limits are shown below.

Sample	DMC	% Recovery	QC Limits
Y2M97	1,2-Dichloroethane-d4	130	78-129
Y2M98	1,2-Dichloroethane-d4	133	78-129
Y2M99	1,2-Dichloroethane-d4	133	78-129

The detected result may be biased high. Recoveries for DMC 1,2-dichloroethane-d4 in samples Y2M97 and Y2M98 exceeded QC limits but results were not qualified because they were nondetects. The samples were not reanalyzed.

*Surrogates (e.g., deuterated monitoring compounds (DMCs)) are organic compounds which are similar to the target analytes in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. All samples are spiked with DMCs prior to purging. DMCs provide information about both the laboratory performance on individual samples and the possible effects of the sample matrix on the analytical results.*

- D. The matrix spike and matrix spike duplicate recoveries for trichloroethene (TCE) in QC samples Y2M90MS and Y2M90MSD did not meet the criteria for accuracy specified in the SOW, as shown below.

Analyte	Y2M90MS	Y2M90MSD	QC limits		
	% Recovery	% Recovery	RPD	RPD	% Recovery
Trichloroethene	66	66	0	14	71-120

Results obtained may indicate poor laboratory technique or matrix effects which may interfere with analysis. Since the TCE result in sample Y2M90 is nondetected,

a false negative may exist. The effect on data quality for other samples is not known.

*Matrix spike sample analysis provides information about the effect of the sample matrix on sample preparation and measurement.*

- E. In the analysis of the field duplicate pair, the following outlier was reported.

<u>Analyte</u>	Y2MA0 (D1) <u>Conc., µg/L</u>	Y2M92 (D1) <u>Conc., µg/L</u>	<u>RPD (&lt;25%)</u>
Acetone	5.3	5.0U	N/A

The effect on data quality is not known.

*The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results of the analysis of the field duplicate pair may be due to the sample matrix or poor sampling or laboratory technique.*

**TABLE 1B**  
**DATA QUALIFIER DEFINITIONS FOR ORGANIC DATA REVIEW**

The definitions of the following qualifiers are prepared according to the document, "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review," January 2005.

- U     The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.
- L     Indicates results which fall below the Contract Required Quantitation Limit. Results are estimated and are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.
- J     The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).
- NJ    The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ    The analyte was not detected at a level greater than or equal to the adjusted CRQL. However, the reported adjusted CRQL is approximate and may be inaccurate or imprecise.
- R     The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

## MEMORANDUM

**DATE:** 28 September 2006

**TO:** Ben Castellana, Ph.D., Weston Solutions, Sherman Oaks

**FROM:** Paul Swift, Ph.D., Weston Solutions, Seattle *RS, JR*

**SUBJECT:** Review and Validation – Radiochemistry Data  
*Laboratory Group: 550874*  
*Site: Halaco Engineering Company, Oxnard, California*  
*Project: Integrated Assessment*

**CONTRACT:** GSA W91238-05-F-0052

**WORK ORDER:** 12767.062.317.5000

**cc:** Weston Solutions project file

The quality assurance review and validation of analytical results from 1 soil sample, laboratory group **550874**, collected from the Halaco Engineering Company site, 6200 Perkins Road, Oxnard, Ventura County, California 27 June 2006 has been completed.

The single soil sample was analyzed for thorium isotopes (Th-228, Th-230, Th-232) and selected gamma-emitting isotopes (potassium-40 and cesium-136; K-40 and Cs-136) by General Engineering Laboratories, LLC, of Charleston, South Carolina. Samples were analyzed following DOE EML HASL Method 300, Th-01-RC (modified), alpha spectrometry by gas proportional counting, and EML HASL Method 300 (4.5.2.3), gamma spectrometry by scintillation counting, respectively.

The EDD Summary Report, listing the sample ID and method information for the laboratory group included in this review, is provided as an attachment.

## **Data Review, Verification, Validation, and Qualification**

The following comments refer to the laboratory performance in meeting the quality control criteria described in the individual analytical methods. The review follows the format described in the *National Functional Guidelines for Inorganic Data Review* (USEPA 2004) and specific procedural details provided in the individual analytical methods and the analytical laboratory's standard operating procedures.

Electronic data deliverables compliant with EPA's Staged Electronic Data Deliverable (SEDD) Stage 2a Specification version 5.0 (EPA 2003) were provided by the laboratories as extensible markup language (XML) text files. These deliverables were processed using the LDC Parsing Tool, version 5.0, prior to importing into the LDC/USACE Automated Data Review (ADR) software. Using ADR, laboratory quality control results (method blanks, laboratory control standard and matrix spike recoveries, duplicate spike precision values), along with analysis holding time compliance, were evaluated relative to project quality control criteria specified in the Work Plan (Weston 2006). Detection and reporting limits also were compared to project-specified targets.

Other QC criteria (instrument calibrations, calibration check sample recoveries, and frequencies of QC sample analyses) were reviewed and verified manually.

Data validation was performed to assess overall data quality and usability relative to project data quality objectives (DQOs) specified in the project Quality Assurance Project Plan (QAPP).

### **RADIOCHEMICAL ANALYSIS – THORIUM ISOTOPES BY ALPHA SPECTROMETRY (DOE EML HASL 300, Th-01-RC -Modified)**

#### **1. Timeliness – acceptable**

All samples met the project-specific holding time criterion of 40 days between sample collection and analysis.

#### **2. Initial Calibration – acceptable**

The initial calibration data met the acceptance criteria specified in the analytical method.

#### **3. Continuing Calibration Check Sample Analysis – acceptable**

The continuing calibration check sample analysis results met the criteria specified in the analytical method.

**4. Detection Limits – acceptable**

Laboratory minimum detectable activities (MDA) and method reporting limits (MRL) met project-required reporting limits. The laboratory data qualifier “B” was added by the reviewer to results detected between the MDA and MRL to facilitate ADR processing.

**5. Blank Sample Analysis – acceptable**

a) Laboratory Method Blanks

Laboratory method blank frequency and recovery criteria were met.

b) Laboratory Instrument Blanks

Project DQOs were not negatively affected by any laboratory blank detections.

c) Field / Equipment Blanks

No field blanks were associated with this analytical group.

**6. Laboratory Control Sample Analysis (LCS) – acceptable**

Recoveries of the analytes from the LCS (blank spike) samples met the acceptance criteria in use at the laboratory.

**7. Matrix Spike Sample Analysis (MS) – acceptable**

Analyte recoveries from the MS samples were sufficient to meet project DQOs.

**8. Laboratory Duplicate Sample Analysis – acceptable**

Analytical precision, estimated through duplicate sample analysis, was sufficient to achieve project data quality objectives.

**9. Field Duplicate Sample Analysis – not applicable**

Field duplicate samples were not submitted for analysis.

**10. Sample Geometry – acceptable**

All counting sources were prepared in the same geometry as the calibration standards.

**11. Sample Analysis – acceptable**

All laboratory deliverables were present. No discrepancies were noted.

## RADIOCHEMICAL ANALYSIS – GAMMA SPECTROMETRY (EML HASL 300-4.5.2.3)

### 1. Timeliness – *acceptable*

All samples met the project-specific holding time criterion of 40 days between sample collection and analysis.

### 2. Initial Calibration – *acceptable*

The initial calibration data met the acceptance criteria specified in the analytical method.

### 3. Continuing Calibration Check Sample Analysis – *acceptable*

The continuing calibration check sample analysis results met the criteria specified in the analytical method.

### 4. Detection Limits – *acceptable*

Laboratory minimum detectable activities (MDA) and method reporting limits (MRL) met project-required reporting limits. The laboratory data qualifier “B” was added by the reviewer to results detected between the MDA and MRL to facilitate ADR processing.

### 5. Blank Sample Analysis – *acceptable*

#### a) Laboratory Method Blanks

Laboratory method blank frequency and recovery criteria were met.

#### d) Laboratory Instrument Blanks

Project DQOs were not negatively affected by any laboratory blank detections.

#### e) Field / Equipment Blanks

No field blanks were associated with this analytical group.

### 6. Laboratory Control Sample Analysis (LCS) – *acceptable*

Recoveries of the analytes from the LCS (blank spike) samples met the acceptance criteria in use at the laboratory.

### 7. Matrix Spike Sample Analysis (MS) – *not applicable*

Matrix spike sample analysis was not performed for this laboratory group.

**8. Laboratory Control Sample Duplicate Analysis – *acceptable***

Analytical precision, estimated through duplicate sample analysis, was sufficient to achieve project data quality objectives.

**9. Field Duplicate Sample Analysis – *not applicable***

Field duplicate samples were not submitted for analysis.

**10. Sample Geometry – *acceptable***

All counting sources were prepared in the same geometry as the calibration standards.

**11. Sample Analysis – *acceptable***

All laboratory deliverables were present. No discrepancies were noted.

### **Laboratory Contact**

No other laboratory contact was required for corrective action purposes.

### **Data Assessment and Reconciliation with Project Data Quality Objectives**

Data review and validation was performed by an experienced quality assurance chemist independent of the analytical laboratory and not directly involved in the collection of samples for the project.

Upon consideration of the comments and data qualifications noted above and the project data quality objectives specified in the QAPP, the data are ACCEPTABLE for use except where flagged with data qualifiers that modify the usefulness of the individual values.

### **Data Qualifiers**

**Any data qualifiers applied by the laboratory have been removed from the data summary sheets and superceded by data validation qualifiers as follow:**

The following qualifiers are used to modify the data quality and usefulness of individual analytical results.

- U - The compound was analyzed for, but was not detected.
- J - The analyte was positively identified, but the associated numerical value is an estimated quantity because quality control criteria were not met or because concentrations reported are less than the laboratory reporting limit or lowest calibration standard.

## **MEMORANDUM**

**DATE:** 29 September 2006

**TO:** Ben Castellana, Ph.D., Weston Solutions, Sherman Oaks

**FROM:** Paul Swift, Ph.D., Weston Solutions, Seattle *RS/JR*

**SUBJECT:** Review and Validation – Radiochemistry Data  
*Laboratory Groups:* 545042, 545083, 545086, 545092, 545368, 545369, 545370, 545372, and 545373  
*Site:* Halaco Engineering Company, Oxnard, California  
*Project:* Integrated Assessment

**CONTRACT:** GSA W91238-05-F-0052

**WORK ORDER:** 12767.062.317.5000

**cc:** Weston Solutions project file

The quality assurance review and validation of analytical results from 127 solid samples (84 soil and 43 sediment), laboratory groups **545042, 545083, 545086, 545092, 545368, 545369, 545370, 545372, and 545373**, collected from the Halaco Engineering Company site, 6200 Perkins Road, Oxnard, Ventura County, California between 27 June and 29 June 2006 has been completed.

The solid samples were analyzed for thorium isotopes (Th-228, Th-230, Th-232) and selected gamma-emitting isotopes (potassium-40 and cesium-136; K-40 and Cs-136) by General Engineering Laboratories, LLC, of Charleston, South Carolina. Samples were analyzed following DOE EML HASL Method 300, Th-01-RC (modified), alpha spectrometry by gas proportional counting, and EML HASL Method 300 (4.5.2.3), gamma spectrometry by scintillation counting, respectively.

The EDD Summary Report, listing the sample ID and method information for the laboratory groups included in this review, is provided as an attachment.

## **Data Review, Verification, Validation, and Qualification**

The following comments refer to the laboratory performance in meeting the quality control criteria described in the individual analytical methods. The review follows the format described in the *National Functional Guidelines for Inorganic Data Review* (USEPA 2004) and specific procedural details provided in the individual analytical methods and the analytical laboratory's standard operating procedures.

Electronic data deliverables compliant with EPA's Staged Electronic Data Deliverable (SEDD) Stage 2a Specification version 5.0 (EPA 2003) were provided by the laboratories as extensible markup language (XML) text files. These deliverables were processed using the LDC Parsing Tool, version 5.0, prior to importing into the LDC/USACE Automated Data Review (ADR) software. Using ADR, laboratory quality control results (method blanks, laboratory control standard and matrix spike recoveries, duplicate spike precision values), along with analysis holding time compliance, were evaluated relative to project quality control criteria specified in the Work Plan (Weston 2006). Detection and reporting limits also were compared to project-specified targets.

Other QC criteria (instrument calibrations, calibration check sample recoveries, and frequencies of QC sample analyses) were reviewed and verified manually.

Data validation was performed to assess overall data quality and usability relative to project data quality objectives (DQOs) specified in the project Quality Assurance Project Plan (QAPP).

### **RADIOCHEMICAL ANALYSIS – THORIUM ISOTOPES BY ALPHA SPECTROMETRY (DOE EML HASL 300, Th-01-RC -Modified)**

#### **1. Timeliness – acceptable**

All samples met the project-specific holding time criterion of 40 days between sample collection and analysis.

#### **2. Initial Calibration – acceptable**

The initial calibration data met the acceptance criteria specified in the analytical method.

#### **3. Continuing Calibration Check Sample Analysis – acceptable**

The continuing calibration check sample analysis results met the criteria specified in the analytical method.

**4. Detection Limits – acceptable**

Laboratory minimum detectable activities (MDA) and method reporting limits (MRL) met project-required reporting limits. The laboratory data qualifier “B” was added by the reviewer to results detected between the MDA and MRL to facilitate ADR processing.

**5. Blank Sample Analysis – acceptable**

a) Laboratory Method Blanks

Laboratory method blank frequency and recovery criteria were met.

b) Laboratory Instrument Blanks

Project DQOs were not negatively affected by any laboratory blank detections.

c) Field / Equipment Blanks

No field blanks were associated with this analytical group.

**6. Laboratory Control Sample Analysis (LCS) – acceptable**

Recoveries of the analytes from the LCS (blank spike) samples met the acceptance criteria in use at the laboratory.

**7. Matrix Spike Sample Analysis (MS) – acceptable**

Analyte recoveries from the MS samples were sufficient to meet project DQOs.

**8. Laboratory Duplicate Sample Analysis – acceptable**

Analytical precision, estimated through duplicate sample analysis, was sufficient to achieve project data quality objectives.

**9. Field Duplicate Sample Analysis – not applicable**

Field duplicate samples were not submitted for analysis.

**10. Sample Geometry – acceptable**

All counting sources were prepared in the same geometry as the calibration standards.

**11. Sample Analysis – acceptable**

All laboratory deliverables were present. No discrepancies were noted.

## RADIOCHEMICAL ANALYSIS – GAMMA SPECTROMETRY (EML HASL 300-4.5.3.2)

### 1. Timeliness – *acceptable*

All samples met the project-specific holding time criterion of 40 days between sample collection and analysis.

### 2. Initial Calibration – *acceptable*

The initial calibration data met the acceptance criteria specified in the analytical method.

### 3. Continuing Calibration Check Sample Analysis – *acceptable*

The continuing calibration check sample analysis results met the criteria specified in the analytical method.

### 4. Detection Limits – *acceptable*

Laboratory minimum detectable activities (MDA) and method reporting limits (MRL) met project-required reporting limits. The laboratory data qualifier “B” was added by the reviewer to results detected between the MDA and MRL to facilitate ADR processing.

### 5. Blank Sample Analysis – *acceptable*

#### a) Laboratory Method Blanks

Laboratory method blank frequency and recovery criteria were met.

#### d) Laboratory Instrument Blanks

Project DQOs were not negatively affected by any laboratory blank detections.

#### e) Field / Equipment Blanks

No field blanks were associated with this analytical group.

### 6. Laboratory Control Sample Analysis (LCS) – *acceptable*

Recoveries of the analytes from the LCS (blank spike) samples met the acceptance criteria in use at the laboratory.

### 7. Matrix Spike Sample Analysis (MS) – *not applicable*

Matrix spike sample analysis was not performed for this laboratory group.

## 8. Laboratory Duplicate Sample Analysis

Analytical precision, estimated through duplicate sample analysis, was sufficient to achieve project data quality objectives, with the following exception.

Duplicate precision for analysis of sample **SW4-5/20-220606-1355** exceeded the acceptance criterion for thorium-228. Since the relative error ratio for the primary and duplicate sample analyses met the relative error ratio requirement specified in the method, the thorium-228 result in this sample only was qualified as an estimated concentration (J).

## 9. Field Duplicate Sample Analysis – *not applicable*

Field duplicate samples were not submitted for analysis.

## 10. Sample Geometry – *acceptable*

All counting sources were prepared in the same geometry as the calibration standards.

## 11. Sample Analysis

The cesium-137 results from samples **SDF16-280606-1620**, **SDF3-230606-1545**, and **SW5-4/15-260606-0851** were qualified as not detected at an estimated reporting limit (UJ) due to high peak width.

All laboratory deliverables were present. No other discrepancies were noted.

### **Laboratory Contact**

No other laboratory contact was required for corrective action purposes.

### **Data Assessment and Reconciliation with Project Data Quality Objectives**

Data review and validation was performed by an experienced quality assurance chemist independent of the analytical laboratory and not directly involved in the collection of samples for the project.

Upon consideration of the comments and data qualifications noted above and the project data quality objectives specified in the QAPP, the data are ACCEPTABLE for use except where flagged with data qualifiers that modify the usefulness of the individual values.

### **Data Qualifiers**

**Any data qualifiers applied by the laboratory have been removed from the data summary sheets and superceded by data validation qualifiers as follow:**

The following qualifiers are used to modify the data quality and usefulness of individual analytical results.

- U - The compound was analyzed for, but was not detected.
- J - The analyte was positively identified, but the associated numerical value is an estimated quantity because quality control criteria were not met or because concentrations reported are less than the laboratory reporting limit or lowest calibration standard.
- UJ - The analyte not detected. The associated analytical result is an estimated detection limit due to QC exceedance(s).

## **MEMORANDUM**

**DATE:** 28 September 2006

**TO:** Ben Castellana, Ph.D., Weston Solutions, Sherman Oaks

**FROM:** Paul Swift, Ph.D., Weston Solutions, Seattle *RS, JR*

**SUBJECT:** Review and Validation – Radiochemistry Data  
*Laboratory Groups: 545129, 545364*  
*Site: Halaco Engineering Company, Oxnard, California*  
*Project: Integrated Assessment*

**CONTRACT:** GSA W91238-05-F-0052

**WORK ORDER:** 12767.062.317.5000

**cc:** Weston Solutions project file

The quality assurance review and validation of analytical results from 20 water samples (14 ground and 6 surface waters), laboratory groups **545129** and **545364**, collected from the Halaco Engineering Company site, 6200 Perkins Road, Oxnard, Ventura County, California between 27 June and 29 June 2006 has been completed.

The water samples were analyzed for thorium isotopes (Th-228, Th-230, Th-232) and selected gamma-emitting isotopes (potassium-40 and cesium-136; K-40 and Cs-136) by General Engineering Laboratories, LLC, of Charleston, South Carolina. Samples were analyzed following DOE EML HASL Method 300, Th-01-RC (modified), alpha spectrometry by gas proportional counting, and EPA Method 901.1, gamma spectrometry by scintillation counting, respectively.

The EDD Summary Report, listing the sample ID and method information for the laboratory groups included in this review, is provided as an attachment.

## **Data Review, Verification, Validation, and Qualification**

The following comments refer to the laboratory performance in meeting the quality control criteria described in the individual analytical methods. The review follows the format described in the *National Functional Guidelines for Inorganic Data Review* (USEPA 2004) and specific procedural details provided in the individual analytical methods and the analytical laboratory's standard operating procedures.

Electronic data deliverables compliant with EPA's Staged Electronic Data Deliverable (SEDD) Stage 2a Specification version 5.0 (EPA 2003) were provided by the laboratories as extensible markup language (XML) text files. These deliverables were processed using the LDC Parsing Tool, version 5.0, prior to importing into the LDC/USACE Automated Data Review (ADR) software. Using ADR, laboratory quality control results (method blanks, laboratory control standard and matrix spike recoveries, duplicate spike precision values), along with analysis holding time compliance, were evaluated relative to project quality control criteria specified in the Work Plan (Weston 2006). Detection and reporting limits also were compared to project-specified targets.

Other QC criteria (instrument calibrations, calibration check sample recoveries, and frequencies of QC sample analyses) were reviewed and verified manually.

Data validation was performed to assess overall data quality and usability relative to project data quality objectives (DQOs) specified in the project Quality Assurance Project Plan (QAPP).

### **RADIOCHEMICAL ANALYSIS – THORIUM ISOTOPES BY ALPHA SPECTROMETRY (DOE EML HASL 300, Th-01-RC -Modified)**

#### **1. Timeliness – acceptable**

All samples met the project-specific holding time criterion of 40 days between sample collection and analysis.

#### **2. Initial Calibration – acceptable**

The initial calibration data met the acceptance criteria specified in the analytical method.

#### **3. Continuing Calibration Check Sample Analysis – acceptable**

The continuing calibration check sample analysis results met the criteria specified in the analytical method.

**4. Detection Limits – acceptable**

Laboratory minimum detectable activities (MDA) and method reporting limits (MRL) met project-required reporting limits. The laboratory data qualifier “B” was added by the reviewer to results detected between the MDA and MRL to facilitate ADR processing.

**5. Blank Sample Analysis – acceptable****a) Laboratory Method Blanks**

Laboratory method blank frequency and recovery criteria were met.

**b) Laboratory Instrument Blanks**

Project DQOs were not negatively affected by any laboratory blank detections.

**c) Field / Equipment Blanks**

No field blanks were associated with this analytical group.

**6. Laboratory Control Sample Analysis (LCS) – acceptable**

Recoveries of the analytes from the LCS (blank spike) samples met the acceptance criteria in use at the laboratory.

**7. Matrix Spike Sample Analysis (MS) – acceptable**

Analyte recoveries from the MS sample were sufficient to meet project DQOs.

**8. Laboratory Duplicate Sample Analysis – acceptable**

Analytical precision, estimated through duplicate sample analysis, was sufficient to achieve project data quality objectives.

**9. Field Duplicate Sample Analysis – not applicable**

Field duplicate samples were not submitted for analysis.

**10. Sample Geometry – acceptable**

All counting sources were prepared in the same geometry as the calibration standards.

**11. Sample Analysis – acceptable**

All laboratory deliverables were present. No discrepancies were noted.

## RADIOCHEMICAL ANALYSIS – GAMMA SPECTROMETRY (EPA 901.1)

### 1. Timeliness – *acceptable*

All samples met the project-specific holding time criterion of 40 days between sample collection and analysis.

### 2. Initial Calibration – *acceptable*

The initial calibration data met the acceptance criteria specified in the analytical method.

### 3. Continuing Calibration Check Sample Analysis – *acceptable*

The continuing calibration check sample analysis results met the criteria specified in the analytical method.

### 4. Detection Limits – *acceptable*

Laboratory minimum detectable activities (MDA) and method reporting limits (MRL) met project-required reporting limits. The laboratory data qualifier “B” was added by the reviewer to results detected between the MDA and MRL to facilitate ADR processing.

### 5. Blank Sample Analysis – *acceptable*

#### a) Laboratory Method Blanks

Laboratory method blank frequency and recovery criteria were met.

#### d) Laboratory Instrument Blanks

Project DQOs were not negatively affected by any laboratory blank detections.

#### e) Field / Equipment Blanks

No field blanks were associated with this analytical group.

### 6. Laboratory Control Sample Analysis (LCS) – *acceptable*

Recoveries of the analytes from the LCS (blank spike) sample met the acceptance criteria in use at the laboratory.

### 7. Matrix Spike Sample Analysis (MS) – *acceptable*

Recoveries of the analytes from the MS sample met the acceptance criteria in use at the laboratory.

**8. Laboratory Duplicate Sample Analysis – *acceptable***

Analytical precision, estimated through duplicate sample analysis, was sufficient to achieve project data quality objectives.

**9. Field Duplicate Sample Analysis – *not applicable***

Field duplicate samples were not submitted for analysis.

**10. Sample Geometry – *acceptable***

All counting sources were prepared in the same geometry as the calibration standards.

**11. Sample Analysis – *acceptable***

Potassium-40 results from samples **MW15-280606-1822** and **WS10-280606-1630** were qualified as not detected at an estimated reporting limit (UJ) due to high counting uncertainty.

The potassium-40 result from sample **WS1-280606-1245** was qualified as not detected at an estimated reporting limit (UJ) due to low abundance.

The cesium-137 result from sample **MW2A-280606-0758** was qualified as not detected at an estimated reporting limit (UJ) due to high peak width.

All laboratory deliverables were present. No other discrepancies were noted.

### **Laboratory Contact**

No other laboratory contact was required for corrective action purposes.

### **Data Assessment and Reconciliation with Project Data Quality Objectives**

Data review and validation was performed by an experienced quality assurance chemist independent of the analytical laboratory and not directly involved in the collection of samples for the project.

Upon consideration of the comments and data qualifications noted above and the project data quality objectives specified in the QAPP, the data are ACCEPTABLE for use except where flagged with data qualifiers that modify the usefulness of the individual values.

### **Data Qualifiers**

**Any data qualifiers applied by the laboratory have been removed from the data summary sheets and superceded by data validation qualifiers as follow:**

The following qualifiers are used to modify the data quality and usefulness of individual analytical results.

- U - The compound was analyzed for, but was not detected.
- J - The analyte was positively identified, but the associated numerical value is an estimated quantity because quality control criteria were not met or because concentrations reported are less than the laboratory reporting limit or lowest calibration standard.

## **MEMORANDUM**

**DATE:** 28 September 2006

**TO:** Ben Castellana, Ph.D., Weston Solutions, Sherman Oaks

**FROM:** Paul Swift, Ph.D., Weston Solutions, Seattle *RS, JR*

**SUBJECT:** Review and Validation – Radiochemistry Data  
*Laboratory Group: 545133*  
*Site: Halaco Engineering Company, Oxnard, California*  
*Project: Integrated Assessment*

**CONTRACT:** GSA W91238-05-F-0052

**WORK ORDER:** 12767.062.317.5000

**cc:** Weston Solutions project file

The quality assurance review and validation of analytical results from 5 ground water samples, laboratory group **545133**, collected from the Halaco Engineering Company site, 6200 Perkins Road, Oxnard, Ventura County, California between 27 June and 29 June 2006 has been completed.

The water samples were analyzed for thorium isotopes (Th-228, Th-230, Th-232) and selected gamma-emitting isotopes (potassium-40 and cesium-136; K-40 and Cs-136) by General Engineering Laboratories, LLC, of Charleston, South Carolina. Samples were analyzed following DOE EML HASL Method 300, Th-01-RC (modified), alpha spectrometry by gas proportional counting, and EPA Method 901.1, gamma spectrometry by scintillation counting, respectively.

The EDD Summary Report, listing the sample ID and method information for the laboratory groups included in this review, is provided as an attachment.

## **Data Review, Verification, Validation, and Qualification**

The following comments refer to the laboratory performance in meeting the quality control criteria described in the individual analytical methods. The review follows the format described in the *National Functional Guidelines for Inorganic Data Review* (USEPA 2004) and specific procedural details provided in the individual analytical methods and the analytical laboratory's standard operating procedures.

Electronic data deliverables compliant with EPA's Staged Electronic Data Deliverable (SEDD) Stage 2a Specification version 5.0 (EPA 2003) were provided by the laboratories as extensible markup language (XML) text files. These deliverables were processed using the LDC Parsing Tool, version 5.0, prior to importing into the LDC/USACE Automated Data Review (ADR) software. Using ADR, laboratory quality control results (method blanks, laboratory control standard and matrix spike recoveries, duplicate spike precision values), along with analysis holding time compliance, were evaluated relative to project quality control criteria specified in the Work Plan (Weston 2006). Detection and reporting limits also were compared to project-specified targets.

Other QC criteria (instrument calibrations, calibration check sample recoveries, and frequencies of QC sample analyses) were reviewed and verified manually.

Data validation was performed to assess overall data quality and usability relative to project data quality objectives (DQOs) specified in the project Quality Assurance Project Plan (QAPP).

### **RADIOCHEMICAL ANALYSIS – THORIUM ISOTOPES BY ALPHA SPECTROMETRY (DOE EML HASL 300, Th-01-RC -Modified)**

#### **1. Timeliness – acceptable**

All samples met the project-specific holding time criterion of 40 days between sample collection and analysis.

#### **2. Initial Calibration – acceptable**

The initial calibration data met the acceptance criteria specified in the analytical method.

#### **3. Continuing Calibration Check Sample Analysis – acceptable**

The continuing calibration check sample analysis results met the criteria specified in the analytical method.

**4. Detection Limits – acceptable**

Laboratory minimum detectable activities (MDA) and method reporting limits (MRL) met project-required reporting limits. The laboratory data qualifier “B” was added by the reviewer to results detected between the MDA and MRL to facilitate ADR processing.

**5. Blank Sample Analysis – acceptable**

a) Laboratory Method Blanks

Laboratory method blank frequency and recovery criteria were met.

b) Laboratory Instrument Blanks

Project DQOs were not negatively affected by any laboratory blank detections.

c) Field / Equipment Blanks

No field blanks were associated with this analytical group.

**6. Laboratory Control Sample Analysis (LCS) – acceptable**

Recoveries of the analytes from the LCS (blank spike) samples met the acceptance criteria in use at the laboratory.

**7. Matrix Spike Sample Analysis (MS) – acceptable**

Analyte recoveries from the MS samples were sufficient to meet project DQOs.

**8. Laboratory Duplicate Sample Analysis – acceptable**

Analytical precision, estimated through duplicate sample analysis, was sufficient to achieve project data quality objectives.

**9. Field Duplicate Sample Analysis – not applicable**

Field duplicate samples were not submitted for analysis.

**10. Sample Geometry – acceptable**

All counting sources were prepared in the same geometry as the calibration standards.

**11. Sample Analysis – acceptable**

All laboratory deliverables were present. No discrepancies were noted.

## RADIOCHEMICAL ANALYSIS – GAMMA SPECTROMETRY (EPA 901.1)

### 1. Timeliness – *acceptable*

All samples met the project-specific holding time criterion of 40 days between sample collection and analysis.

### 2. Initial Calibration – *acceptable*

The initial calibration data met the acceptance criteria specified in the analytical method.

### 3. Continuing Calibration Check Sample Analysis – *acceptable*

The continuing calibration check sample analysis results met the criteria specified in the analytical method.

### 4. Detection Limits – *acceptable*

Laboratory minimum detectable activities (MDA) and method reporting limits (MRL) met project-required reporting limits. The laboratory data qualifier “B” was added by the reviewer to results detected between the MDA and MRL to facilitate ADR processing.

### 5. Blank Sample Analysis – *acceptable*

#### a) Laboratory Method Blanks

Laboratory method blank frequency and recovery criteria were met.

#### d) Laboratory Instrument Blanks

Project DQOs were not negatively affected by any laboratory blank detections.

#### e) Field / Equipment Blanks

No field blanks were associated with this analytical group.

### 6. Laboratory Control Sample Analysis (LCS) – *acceptable*

Recoveries of the analytes from the LCS (blank spike) samples met the acceptance criteria in use at the laboratory.

### 7. Matrix Spike Sample Analysis (MS) – *not applicable*

Matrix spike sample analysis was not performed for this laboratory group.

**8. Laboratory Duplicate Sample Analysis – *acceptable***

Analytical precision, estimated through duplicate sample analysis, was sufficient to achieve project data quality objectives.

**9. Field Duplicate Sample Analysis – *not applicable***

Field duplicate samples were not submitted for analysis.

**10. Sample Geometry – *acceptable***

All counting sources were prepared in the same geometry as the calibration standards.

**11. Sample Analysis – *acceptable***

All laboratory deliverables were present. No other discrepancies were noted.

### **Laboratory Contact**

No other laboratory contact was required for corrective action purposes.

### **Data Assessment and Reconciliation with Project Data Quality Objectives**

Data review and validation was performed by an experienced quality assurance chemist independent of the analytical laboratory and not directly involved in the collection of samples for the project.

Upon consideration of the comments and data qualifications noted above and the project data quality objectives specified in the QAPP, the data are ACCEPTABLE for use except where flagged with data qualifiers that modify the usefulness of the individual values.

### **Data Qualifiers**

**Any data qualifiers applied by the laboratory have been removed from the data summary sheets and superceded by data validation qualifiers as follow:**

The following qualifiers are used to modify the data quality and usefulness of individual analytical results.

- U - The compound was analyzed for, but was not detected.
- J - The analyte was positively identified, but the associated numerical value is an estimated quantity because quality control criteria were not met or because concentrations reported are less than the laboratory reporting limit or lowest calibration standard.

## EDD Summary Report by Client Sample ID

**Laboratory Reporting Batch :** 545133

## ANALYTICAL DATA REVIEW SUMMARY

### Tier 2 Validation

<b>Site Name:</b> Halaco	<b>Location:</b> Oxnard, California
<b>Project Number:</b> 60005003.27	

### DATA VALIDATION SUMMARY

The data were reviewed following procedures and limits specified in the EPA OSWER directive, *Quality Assurance/Quality Control Guidance for Removal Activities, Sampling QA/QC Plan and Data Validation Procedures* (EPA/540/G-90/004, OSWER Directive 9360.4-01, dated April 1990).

Indicate with a YES or NO whether each item is acceptable without qualification:

<b>1</b>	<b>Holding Times</b>	<b>YES</b>
<b>2</b>	<b>Initial and Continuing Calibrations</b>	<b>YES</b>
<b>3</b>	<b>Laboratory Control Sample</b>	<b>YES</b>
<b>4</b>	<b>Matrix Spike</b>	<b>YES</b>
<b>5</b>	<b>Blanks and Background Samples</b>	<b>YES</b>
<b>6</b>	<b>Duplicate Analyses</b>	<b>YES</b>
<b>7</b>	<b>Interference Check Samples and Serial Dilution Analysis</b>	<b>YES</b>
<b>8</b>	<b>Post Digestion Spike and Standard Addition Analysis</b>	<b>YES</b>
<b>9</b>	<b>Analyte Quantitation</b>	<b>YES</b>
<b>10</b>	<b>Overall Assessment of Data</b>	<b>YES</b>
<b>11</b>	<b>Usability of Data</b>	<b>YES</b>

**Comments:** Eighteen soil samples were analyzed for STLC Metals and no data were qualified from this SDG.

# ANALYTICAL DATA REVIEW SUMMARY

## Tier 2 Validation

Site Name: Halaco	Location: Oxnard, California
Project Number: 60005003.27	

### 1. HOLDING TIMES

- Acceptable  
 Acceptable with qualification  
 Unacceptable

Samples were extracted and analyzed within required holding times except as noted under Comments. In addition, no problems were identified with regard to sample preservation or custody unless specified. For those samples analyzed outside holding time requirements, the detected results have been qualified as estimated (J), and the nondetected results have been qualified either as estimated (UJ) or rejected (R) based on the reviewer's judgement.

**All Sample Matrices:**

Mercury: 28 days (from collection) for analysis.  
Hexavalent chromium: 24 hours (from collection) for analysis.  
All other metals: 180 days (from collection) for analysis.

**Comments:** Analysis met holding time criteria.

### 2. INITIAL AND CONTINUING CALIBRATION VERIFICATION

- Acceptable  
 Acceptable with qualification  
 Unacceptable

Unless flagged below, an initial calibration verification (ICV) and a calibration blank were analyzed at the beginning of the run, and a continuing calibration verification (CCV) and a calibration blank were analyzed after every ten samples, and at the end of the run. ICV and CCV recoveries were within a range of 80-120% for mercury and tin, and 90-110% for all other metals. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 65% or above 135% (for mercury and tin) or below 75% or above 125% (for all other metals), all associated data are rejected (R).

**Comments:** All recoveries of initial and continuing calibration verification were within the control limits.

## MEMORANDUM

**DATE:** 18 September 2006

**TO:** Ben Castellana, Ph.D., Weston Solutions, Sherman Oaks

**FROM:** Paul Swift, Ph.D., Weston Solutions, Seattle *(Signature)*

**SUBJECT:** Review and Validation Metals Data  
*Laboratory Group: FISH01*  
*Site: Halaco Engineering Company, Oxnard, California*  
*Project: Integrated Assessment*

**CONTRACT:** GSA W91238-05-F-0052

**WORK ORDER:** 12767.062.317.5000

**cc:** Weston Solutions project file

The quality assurance review and validation of analytical results from 9 fish samples, laboratory group **FISH01**, collected from the Halaco Engineering Company site, 6200 Perkins Road, Oxnard, Ventura County, California between 26 June and 29 June, 2006 has been completed. The whole fish tissue samples were analyzed for CLP Target Analyte List (TAL) metals (aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc) by Laucks Testing Laboratories, Inc., of Seattle, Washington.

Samples were prepared following EPA Method 200.3, acid digestion of biological matrices, and analyzed following EPA Method 6020A, inductively-coupled plasma – mass spectrometry (ICP-MS).

The samples were numbered:

<b>FISH1-260606-0930</b>	<b>FISH2-260606-0930</b>	<b>FISH3-260606-1130</b>	<b>FISH4-260606-1500</b>
<b>FISH5-260606-1500</b>	<b>FISH6-280606-1130</b>	<b>FISH7-280606-1440</b>	<b>FISH9-280606-1500</b>
<b>FISH10-290606-0930</b>			

## **Data Qualifications**

The following comments refer to the laboratory performance in meeting the quality control criteria described in the individual analytical methods. The review follows the format described in the *National Functional Guidelines for Inorganic Data Review* (USEPA 2004) and specific procedural details provided in the individual analytical methods and the analytical laboratory's standard operating procedures.

Data validation was performed to assess overall data quality and usability relative to project data quality objectives (DQOs) specified in the project Quality Assurance Project Plan (QAPP).

### **METALS ANALYSIS (SW846 6020A)**

#### **1. Timeliness – acceptable**

All samples met holding time criteria of 180 days for the initial sample analysis.

#### **2. Initial Calibration – acceptable**

The initial calibration data met the acceptance criteria specified in the analytical method.

#### **3. Continuing Calibration Check Sample Analysis – acceptable**

The continuing calibration check sample analysis results met the criteria specified in the analytical method.

#### **4. Detection Limits – acceptable**

Laboratory method detection limits (MDL) and reporting limits met project-required reporting limits.

#### **5. Blank Sample Analysis – acceptable**

##### **a) Laboratory Method Blanks**

Laboratory method blank frequency and recovery criteria were met.

##### **b) Laboratory Instrument Blanks**

Project DQOs were not negatively affected by any laboratory blank detections.

##### **c) Field / Equipment Blanks**

No field blanks were associated with this analytical group.

**6. Laboratory Control Sample Analysis (LCS) – acceptable**

Recovery of the analytes from the LCS (blank spike) samples met the acceptance criteria in use at the laboratory.

**7. Matrix Spike and Matrix Spike Duplicate Sample Analysis (MS/MSD) – acceptable**

Analyte recoveries from the MS/MSD samples were sufficient to meet project DQOs.

**8. Laboratory Duplicate Sample Analysis – not applicable**

Duplicate sample analysis was not performed for this sample delivery group.

**9. Field Duplicate Sample Analysis – not applicable**

Field duplicate samples were not submitted for analysis.

**10. Serial Dilution Analysis**

Serial dilution percent difference determinations met method acceptance criteria, with the following exception.

Serial dilution percent difference for barium (22.3%) and selenium (18.9%) exceeded the acceptance criterion of 10 percent as specified in the analytical method. Both barium and selenium were detected in all samples, and the associated results were qualified as estimated concentrations (J), unknown bias (K).

**11. Interference Check Sample Analysis – acceptable**

All interference check sample analyses met method acceptance criteria.

**12. Sample Analysis – acceptable**

All laboratory deliverables were present. No discrepancies were noted.

### **Laboratory Contact**

No laboratory contact was required for corrective action purposes.

### **Data Assessment and Reconciliation with Project Data Quality Objectives**

Data review and validation was performed by an experienced quality assurance chemist independent of the analytical laboratory and not directly involved in the collection of samples for the project.

Upon consideration of the comments and data qualifications noted above and the project data quality objectives specified in the QAPP, the data are ACCEPTABLE for use except where flagged with data qualifiers that modify the usefulness of the individual values.

### **Data Qualifiers**

**Any data qualifiers applied by the laboratory have been removed from the data summary sheets and superceded by data validation qualifiers as follow:**

The following qualifiers are used to modify the data quality and usefulness of individual analytical results.

- U - The compound was analyzed for, but was not detected.
- J - The analyte was positively identified, but the associated numerical value is an estimated quantity because quality control criteria were not met or because concentrations reported are less than the laboratory reporting limit or lowest calibration standard.
- K - Unknown bias.

## ANALYTICAL DATA REVIEW SUMMARY

### Tier 2 Validation

<b>Site Name:</b> Halaco	<b>Location:</b> Oxnard, California
<b>Project Number:</b> 60005003.27	

### DATA VALIDATION SUMMARY

The data were reviewed following procedures and limits specified in the EPA OSWER directive, *Quality Assurance/Quality Control Guidance for Removal Activities, Sampling QA/QC Plan and Data Validation Procedures* (EPA/540/G-90/004, OSWER Directive 9360.4-01, dated April 1990).

Indicate with a YES or NO whether each item is acceptable without qualification:

<b>1</b>	<b>Holding Times</b>	<b>YES</b>
<b>2</b>	<b>Initial and Continuing Calibrations</b>	<b>YES</b>
<b>3</b>	<b>Laboratory Control Sample</b>	<b>NO</b>
<b>4</b>	<b>Matrix Spike</b>	<b>NA</b>
<b>5</b>	<b>Blanks and Background Samples</b>	<b>NO</b>
<b>6</b>	<b>Duplicate Analyses</b>	<b>YES</b>
<b>7</b>	<b>Interference Check Samples and Serial Dilution Analysis</b>	<b>YES</b>
<b>8</b>	<b>Post Digestion Spike and Standard Addition Analysis</b>	<b>N/A</b>
<b>9</b>	<b>Analyte Quantitation</b>	<b>YES</b>
<b>10</b>	<b>Overall Assessment of Data</b>	<b>YES</b>
<b>11</b>	<b>Usability of Data</b>	<b>YES</b>

**Comments:** N/A: Not Applicable. NA: Not Analyzed

Twenty five air filter samples were analyzed for CAM Metals by EPA 6010B/7471A.

Percent recoveries of LCS except Barium and Zinc were within the control limits.

Detected Barium and Zinc results were qualified as estimated (J). Blank Filter was submitted for analysis. Trace level of Sb, As, Co, Cu, Pb, Ni and Tl were detected but Ba, Cr, V, & Zn were found at above the reporting limit. These metals detected in the samples were qualified as non-detect (U) when the sample concentration is less than 5X the blank concentration.

# ANALYTICAL DATA REVIEW SUMMARY

## Tier 2 Validation

Site Name: Halaco	Location: Oxnard, California
Project Number: 60005003.27	

### 1. HOLDING TIMES

- Acceptable  
 Acceptable with qualification  
 Unacceptable

Samples were extracted and analyzed within required holding times except as noted under Comments. In addition, no problems were identified with regard to sample preservation or custody unless specified. For those samples analyzed outside holding time requirements, the detected results have been qualified as estimated (J), and the nondetected results have been qualified either as estimated (UJ) or rejected (R) based on the reviewer's judgement.

**All Sample Matrices:**

Mercury: 28 days (from collection) for analysis.  
Hexavalent chromium: 24 hours (from collection) for analysis.  
All other metals: 180 days (from collection) for analysis.

**Comments:** All holding times were met.

### 2. INITIAL AND CONTINUING CALIBRATION VERIFICATION

- Acceptable  
 Acceptable with qualification  
 Unacceptable

Unless flagged below, an initial calibration verification (ICV) and a calibration blank were analyzed at the beginning of the run, and a continuing calibration verification (CCV) and a calibration blank were analyzed after every ten samples, and at the end of the run. ICV and CCV recoveries were within a range of 80-120% for mercury and tin, and 90-110% for all other metals. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 65% or above 135% (for mercury and tin) or below 75% or above 125% (for all other metals), all associated data are rejected (R).

**Comments:** All recoveries of metals in initial and continuing calibration verifications were within the control limits.

# ANALYTICAL DATA REVIEW SUMMARY

## Tier 2 Validation

Site Name: Halaco	Location: Oxnard, California
Project Number: 60005003.27	

### 3. LABORATORY CONTROL SAMPLE

- Acceptable
- Acceptable with qualification
- Unacceptable
- No Laboratory Control Samples Analyzed

Laboratory control sample recoveries are used for a qualitative indication of accuracy (bias) independent of matrix effects. LCS recovery limits should either be specified in the Sampling and Analysis Plan or can be established by the laboratory. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

**Comments:** Percent recoveries of LCS except Barium and Zinc were within the control limits. Detected Barium and Zinc results were qualified as estimated (J).

### 4. MATRIX SPIKE

- Acceptable
- Acceptable with qualification
- Unacceptable
- No Matrix Spikes Analyzed

Matrix spike recoveries are used for a qualitative indication of accuracy (bias) due to matrix effects. Unless flagged below, one laboratory control sample was analyzed at a rate of one per batch or one per 20 samples. Recoveries were within a range of 75-125%.

For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

**Comments:** No sample was designated for matrix spike and matrix spike duplicate but LCS and LCD were analyzed instead.

# ANALYTICAL DATA REVIEW SUMMARY

## Tier 2 Validation

Site Name: Halaco	Location: Oxnard, California
Project Number: 60005003.27	

## 5. BLANKS AND BACKGROUND SAMPLES

- Acceptable  
 Detection Limits Adjusted

The following blanks were analyzed:

- Method (preparation) Blanks  
 Field Blanks  
 Calibration Blanks  
 Rinsate Blanks  
 Background Samples

Preparation (method) blanks were prepared for each batch of samples extracted. A preparation blank was analyzed after every continuing calibration standard, prior to sample analysis unless noted below. Any compound detected in the sample and also detected in any associated blank, must be qualified as non-detect (U) when the sample concentration is less than 5x the blank concentration.

**Comments:** Blank Filter was submitted for analysis. Trace level of Sb, As, Co, Cu, Pb, Ni and Ti were detected but Ba, Cr, V, & Zn were found at above the reporting limit. These metals detected in the samples were qualified as non-detect (U) when the sample concentration is less than 5X the blank concentration.

## 6. DUPLICATE ANALYSES

- Acceptable  
 Acceptable with qualification  
 Unacceptable  
 No Duplicates Analyzed

Type of duplicates analyzed:

- Field Duplicates  
 Laboratory Duplicates

Calculate the relative Percent Difference (RPD) between the members of duplicate pairs using the equation indicated below. Qualify the detected results as estimated (J) for any analyte whose RPD in a laboratory duplicate exceeds 20% for water samples or 35% for soil samples.

$$RPD = \frac{2(Value\ 1 - Value\ 2)}{Value\ 1 + Value\ 2} \times 100\%$$

**Comments:** RPDs of LCS & LCD <35%.

## ANALYTICAL DATA REVIEW SUMMARY

### Tier 2 Validation

Site Name: Halaco	Location: Oxnard, California
Project Number: 60005003.27	

## 7. INTERFERENCE CHECK SAMPLES AND SERIAL DILUTION ANALYSIS

- Acceptable  
 Acceptable with qualification  
 Unacceptable  
 Not required

**Interference Check Samples (ICS)** - Unless flagged below, an ICS was analyzed at the beginning and end of each run and at least twice every eight hours. Recoveries were within a range of 80-120%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J) if the concentrations of Al, Ca, Fe, or Mg are higher in the sample than in the ICS.

**Serial Dilution Analysis** - Unless flagged below, a serial dilution analysis was performed at a rate of one per 20 samples on a sample having analyte concentrations greater than 50 times the IDL. Percent differences were within a range of 0-10%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

**Comments:** ICS recoveries were within the control limit.  
Sample AIR-1-200606-1750 was used for serial dilution and analytical spike and QC requirements were met.

## 8. POST DIGESTION SPIKE AND STANDARD ADDITIONS

- Acceptable  
 Acceptable with qualification  
 Unacceptable  
 Not required

**Post-digestion spikes** - If a furnace AA result was flagged by the laboratory with an E to indicate interference, and the associated post-digestion spike recovery was less than 10%, the associated results are rejected (R).

**Method of Standard Additions** - If the method of standard additions was required and the correlation coefficient was less than 0.995, the associated results were qualified as estimated (J).

**Comments:**

## ANALYTICAL DATA REVIEW SUMMARY

### Tier 2 Validation

<b>Site Name:</b> Halaco	<b>Location:</b> Oxnard, California
<b>Project Number:</b> 60005003.27	

### 9. ANALYTE QUANTITATION

**Confirm that analyte quantitation was performed correctly using the following formulas:**

**Water samples:**

$$\text{ug/L} = \frac{(\text{Instrument printout concentration, mg/L})(1000 \text{ ug/mg})(\text{final volume of extract, mL})}{(\text{Initial volume of extract, mL})}$$

**Soil samples:**

$$\text{mg/kg} = \frac{(\text{Instrument printout concentration, mg/L})(\text{final volume of extract, mL})(0.001 \text{ L/mL})}{(\text{weight of sample extracted, g})(0.001 \text{ kg/g})(\text{fraction solids})}$$

**Comments:** Analyte quantitation is acceptable. Laboratory reported results in ug/filter and ng/ft3. Sample AIR-1-200606-1750 (4901.175 ft3)

Ba: (12850ug/L) (0.1L/filter) = 1285ug/filter. Lab reported 1290ug/filter.

(1285ug) (1000ng/ug) / (4901.175 ft3) = 262.2ng/ft3. Lab reported 262ng/ft3.

Cr: (84.80ug/L) (0.1L/filter) = 8.48ug/filter. Lab reported 8.48ug/filter.

(8.48ug) (1000ng/ug) / (4901.175 ft3) = 1.73ng/ft3. Lab reported 1.73ng/ft3.

Zn: (8946ug/L) (0.1L/filter) = 894.6ug/filter. Lab reported 895ug/filter.

(894.6ug) (1000ng/ug) / (4901.175 ft3) = 182.5ng/ft3. Lab reported 183ng/ft3.

Sample AIR-2-240606-1752 (4617.6 ft3)

Ba: (13510ug/L) (0.1L/filter) = 1351ug/filter. Lab reported 1350ug/filter.

(1351ug) (1000ng/ug) / (4617.6 ft3) = 292.6ng/ft3. Lab reported 293ng/ft3.

Cu: (132.2ug/L) (0.1L/filter) = 13.22ug/filter. Lab reported 13.2ug/filter.

(13.22ug) (1000ng/ug) / (4617.6ft3) = 2.86ng/ft3. Lab reported 2.87ng/ft3.

Zn: (9019ug/L) (0.1L/filter) = 901.9ug/filter. Lab reported 902ug/filter.

(901.9ug) (1000ng/ug) / (4617.6ft3) = 195.3 ng/ft3. Lab reported 196ng/ft3.

### 10. OVERALL ASSESSMENT OF DATA

**On the basis of this review, the following determination has been made with regard to the overall data usability for the specified level.**

- Acceptable**  
 **Acceptable with Qualification**  
 **Rejected**

**Accepted data meet the minimum requirements for the following EPA data category:**

- ERS Screening**  
 **Non-definitive with 10 % Conformation by Definitive Methodology**  
 **Definitive, Comprehensive Statistical Error Determination was performed.**  
 **Definitive, Comprehensive Statistical Error Determination was not performed.**

**Any qualifications to individual sample analysis results are detailed in the appropriate section above or appear under the comments section below. In cases where several QC criteria are out of specification, it may be appropriate to further qualify the data usability.**

## ANALYTICAL DATA REVIEW SUMMARY

### Tier 2 Validation

<b>Site Name:</b> Halaco	<b>Location:</b> Oxnard, California
<b>Project Number:</b> 60005003.27	

**The data reviewer must use professional judgment and express concerns and comments on the data validity for each specific data package.**

**Comments:** Data as reported are valid.

### 11. USABILITY OF DATA

**A. These data are considered usable for the data use objectives stated in the EPA EMERGENCY RESPONSE SECTION AND SUPERFUND TECHNICAL ASSESSMENT AND RESPONSE TEAM QUALITY ASSURANCE SAMPLING PLAN FOR SOIL, WATER AND MISCELLANEOUS MATRIX SAMPLING, HALACO SITE, OXNARD, VENTURA COUNTY, CALIFORNIA, APRIL 18, 2006 (QASP).**

**The following data use objective was indicated in the QASP:**

*TO ASSIST IN DETERMINING THE PRESENCE OR ABSENCE OF A HAZARDOUS MATERIAL OR SUBSTANCE AT LEVELS ABOVE AN AVAILABLE DETECTION OR QUANTIFICATION LEVEL.*

*TO ASSIST WITH DETERMINING THE AREA OF IMPACT DUE TO A HAZARDOUS MATERIAL RELEASE. (I.E., HORIZONTAL AND LATERIAL EXTENT).*

*TO BE COMPARED TO WITH SITE-SPECIFIC ACTION LEVELS OR RISK-BASED ACTION LEVELS (E.G., EPA PRGS) TO ASSIST IN DETERMINATION IF HEALTH THREATS EXIST.*

*AS DEFINITIVE CONFIRMATORY DATA FOR CONFIRMATION OF NON-DEFINITIVE (SCREENING) DATA.*

*OTHER: TO PROVIDE EVIDENCE OF AN IMMINENT AND SUBSTANTIAL ENDANGERMENT PURSUANT TO THE NCP.*

*THE DATA ARE USABLE FOR THE ABOVE OBJECTIVE.*

### 12. DOCUMENTATION OF LABORATORY CORRECTIVE ACTION

**Problem:** Dilution factor and results for sample AIR-1-230606-173 was incorrect.

**Resolution:** Revised Form I (data summary) was received.

**Attached are copies of all data summary sheets, with data qualifiers indicated, and a copy of the chain of custody for the samples.**

# ANALYTICAL DATA REVIEW SUMMARY

## Tier 2 Validation

<b>Site Name:</b> Halaco	<b>Location:</b> Oxnard, California
<b>Project Number:</b> 60005003.27	

## DATA VALIDATION SUMMARY

The data were reviewed following procedures and limits specified in the EPA OSWER directive, *Quality Assurance/Quality Control Guidance for Removal Activities, Sampling QA/QC Plan and Data Validation Procedures* (EPA/540/G-90/004, OSWER Directive 9360.4-01, dated April 1990).

Indicate with a YES or NO whether each item is acceptable without qualification:

1	Holding Times	YES
2	Initial and Continuing Calibrations	YES
3	Laboratory Control Sample	NO
4	Matrix Spike	NA
5	Blanks and Background Samples	NO
6	Duplicate Analyses	YES
7	Interference Check Samples and Serial Dilution Analysis	YES
8	Post Digestion Spike and Standard Addition Analysis	N/A
9	Analyte Quantitation	YES
10	Overall Assessment of Data	YES
11	Usability of Data	YES

**Comments:** N/A: Not Applicable. NA: Not Analyzed

Twelve air filter samples were analyzed for CAM Metals by EPA 6010B/7471A.

Percent recoveries of LCS except Barium and Zinc were within the control limits.

Detected Barium and Zinc results were qualified as estimated (J). Blank Filter was submitted for analysis. Blank Filter was submitted for analysis. Trace level of Be, Co, Pb, & Mo were detected but Ba, Cr, Cu, Ni, V & Zn were found at above the reporting limit. These metals detected in the samples were qualified as non-detect (U) when the sample concentration is less than 5X the blank concentration.

# ANALYTICAL DATA REVIEW SUMMARY

## Tier 2 Validation

Site Name: Halaco	Location: Oxnard, California
Project Number: 60005003.27	

### 1. HOLDING TIMES

- Acceptable  
 Acceptable with qualification  
 Unacceptable

Samples were extracted and analyzed within required holding times except as noted under Comments. In addition, no problems were identified with regard to sample preservation or custody unless specified. For those samples analyzed outside holding time requirements, the detected results have been qualified as estimated (J), and the nondetected results have been qualified either as estimated (UJ) or rejected (R) based on the reviewer's judgement.

**All Sample Matrices:**

Mercury: 28 days (from collection) for analysis.  
Hexavalent chromium: 24 hours (from collection) for analysis.  
All other metals: 180 days (from collection) for analysis.

**Comments:** All holding times were met.

### 2. INITIAL AND CONTINUING CALIBRATION VERIFICATION

- Acceptable  
 Acceptable with qualification  
 Unacceptable

Unless flagged below, an initial calibration verification (ICV) and a calibration blank were analyzed at the beginning of the run, and a continuing calibration verification (CCV) and a calibration blank were analyzed after every ten samples, and at the end of the run. ICV and CCV recoveries were within a range of 80-120% for mercury and tin, and 90-110% for all other metals. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 65% or above 135% (for mercury and tin) or below 75% or above 125% (for all other metals), all associated data are rejected (R).

**Comments:** All recoveries of metals in initial and continuing calibration verifications were within the control limits.

## ANALYTICAL DATA REVIEW SUMMARY

### Tier 2 Validation

Site Name: Halaco	Location: Oxnard, California
Project Number: 60005003.27	

### 3. LABORATORY CONTROL SAMPLE

- Acceptable
- Acceptable with qualification
- Unacceptable
- No Laboratory Control Samples Analyzed

Laboratory control sample recoveries are used for a qualitative indication of accuracy (bias) independent of matrix effects. LCS recovery limits should either be specified in the Sampling and Analysis Plan or can be established by the laboratory. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

**Comments:** Percent recoveries of LCS except Barium and Zinc were within the control limits. Detected Barium and Zinc results were qualified as estimated (J).

### 4. MATRIX SPIKE

- Acceptable
- Acceptable with qualification
- Unacceptable
- No Matrix Spikes Analyzed

Matrix spike recoveries are used for a qualitative indication of accuracy (bias) due to matrix effects. Unless flagged below, one laboratory control sample was analyzed at a rate of one per batch or one per 20 samples. Recoveries were within a range of 75-125%.

For analytes which exceeded these control limits, associated detected results are qualified as estimated (J). In cases where the recovery was below 30%, all associated nondetected results are rejected (R) and detected results are qualified as estimated (J).

**Comments:** No sample was designated for matrix spike and matrix spike duplicate but LCS and LCD were analyzed instead.

# ANALYTICAL DATA REVIEW SUMMARY

## Tier 2 Validation

Site Name: Halaco	Location: Oxnard, California
Project Number: 60005003.27	

## 5. BLANKS AND BACKGROUND SAMPLES

- Acceptable  
 Detection Limits Adjusted

The following blanks were analyzed:

- Method (preparation) Blanks  
 Field Blanks  
 Calibration Blanks  
 Rinsate Blanks  
 Background Samples

Preparation (method) blanks were prepared for each batch of samples extracted. A preparation blank was analyzed after every continuing calibration standard, prior to sample analysis unless noted below. Any compound detected in the sample and also detected in any associated blank, must be qualified as non-detect (U) when the sample concentration is less than 5x the blank concentration.

**Comments:** Blank Filter was submitted for analysis. Trace level of Be, Co, Pb, & Mo were detected but Ba, Cr, Cu, Ni, V & Zn were found at above the reporting limit. These metals detected in the samples were qualified as non-detect (U) when the sample concentration is less than 5X the blank concentration.

## 6. DUPLICATE ANALYSES

- Acceptable  
 Acceptable with qualification  
 Unacceptable  
 No Duplicates Analyzed

Type of duplicates analyzed:

- Field Duplicates  
 Laboratory Duplicates

Calculate the relative Percent Difference (RPD) between the members of duplicate pairs using the equation indicated below. Qualify the detected results as estimated (J) for any analyte whose RPD in a laboratory duplicate exceeds 20% for water samples or 35% for soil samples.

$$RPD = \frac{2(Value\ 1 - Value\ 2)}{Value\ 1 + Value\ 2} \times 100\%$$

**Comments:** RPDs of LCS & LCD <35%.

## ANALYTICAL DATA REVIEW SUMMARY

### Tier 2 Validation

<b>Site Name:</b> Halaco	<b>Location:</b> Oxnard, California
<b>Project Number:</b> 60005003.27	

### 7. INTERFERENCE CHECK SAMPLES AND SERIAL DILUTION ANALYSIS

- Acceptable  
 Acceptable with qualification  
 Unacceptable  
 Not required

**Interference Check Samples (ICS)** - Unless flagged below, an ICS was analyzed at the beginning and end of each run and at least twice every eight hours. Recoveries were within a range of 80-120%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J) if the concentrations of Al, Ca, Fe, or Mg are higher in the sample than in the ICS.

**Serial Dilution Analysis** - Unless flagged below, a serial dilution analysis was performed at a rate of one per 20 samples on a sample having analyte concentrations greater than 50 times the IDL. Percent differences were within a range of 0-10%. For analytes which exceeded these control limits, associated detected results are qualified as estimated (J).

**Comments:** ICS recoveries were within the control limit.

Sample AIR-6-280606-1544 was used for serial dilution and analytical spike and QC requirements were met.

### 8. POST DIGESTION SPIKE AND STANDARD ADDITIONS

- Acceptable  
 Acceptable with qualification  
 Unacceptable  
 Not required

**Post-digestion spikes** - If a furnace AA result was flagged by the laboratory with an E to indicate interference, and the associated post-digestion spike recovery was less than 10%, the associated results are rejected (R).

**Method of Standard Additions** - If the method of standard additions was required and the correlation coefficient was less than 0.995, the associated results were qualified as estimated (J).

**Comments:**

## Tier 2 Validation

<b>Site Name:</b> Halaco	<b>Location:</b> Oxnard, California
<b>Project Number:</b> 60005003.27	

## 9. ANALYTE QUANTITATION

Confirm that analyte quantitation was performed correctly using the following formulas:

**Water samples:**

$$\text{ug/L} = \frac{(\text{Instrument printout concentration, mg/L})(1000 \text{ ug/mg})(\text{final volume of extract, mL})}{(\text{Initial volume of extract, mL})}$$

**Soil samples:**

$$\text{mg/kg} = \frac{(\text{Instrument printout concentration, mg/L})(\text{final volume of extract, mL})(0.001 \text{ L/mL})}{(\text{weight of sample extracted, g})(0.001 \text{ kg/g})(\text{fraction solids})}$$

**Comments:** Analyte quantitation is acceptable.

Laboratory reported results in ug/filter and ng/ft3.

Sample AIR-6-270606-1638 (10174.61 ft3)

Ba: (15330ug/L) (0.1L/filter) = 1533ug/filter. Lab reported 1530ug/filter.

(1533ug) (1000ng/ug) / (10174.61 ft3) = 150.7ng/ft3. Lab reported 150ng/ft3.

Cr: (137.8ug/L) (0.1L/filter) = 13.78ug/filter. Lab reported 13.8ug/filter.

(13.78ug) (1000ng/ug) / (10174.61 ft3) = 1.35ng/ft3. Lab reported 1.35ng/ft3.

Zn: (9476ug/L) (0.1L/filter) = 947.6ug/filter. Lab reported 948/filter.

(947.6ug) (1000ng/ug) / (10174.61 ft3) = 93.1ng/ft3. Lab reported 92.9ng/ft3.

## 10. OVERALL ASSESSMENT OF DATA

On the basis of this review, the following determination has been made with regard to the overall data usability for the specified level.

- Acceptable  
 Acceptable with Qualification  
 Rejected

Accepted data meet the minimum requirements for the following EPA data category:

- ERS Screening  
 Non-definitive with 10 % Conformation by Definitive Methodology  
 Definitive, Comprehensive Statistical Error Determination was performed.  
 Definitive, Comprehensive Statistical Error Determination was not performed.

Any qualifications to individual sample analysis results are detailed in the appropriate section above or appear under the comments section below. In cases where several QC criteria are out of specification, it may be appropriate to further qualify the data usability. The data reviewer must use professional judgment and express concerns and comments on the data validity for each specific data package.

**Comments:** Data as reported are valid.

## ANALYTICAL DATA REVIEW SUMMARY

### Tier 2 Validation

<b>Site Name:</b> Halaco	<b>Location:</b> Oxnard, California
<b>Project Number:</b> 60005003.27	

### 11. USABILITY OF DATA

A. These data are considered usable for the data use objectives stated in the EPA EMERGENCY RESPONSE SECTION AND SUPERFUND TECHNICAL ASSESSMENT AND RESPONSE TEAM QUALITY ASSURANCE SAMPLING PLAN FOR SOIL, WATER AND MISCELLANEOUS MATRIX SAMPLING, HALACO SITE, OXNARD, VENTURA COUNTY, CALIFORNIA, APRIL 18, 2006 (QASP).

The following data use objective was indicated in the QASP:

TO ASSIST IN DETERMINING THE PRESENCE OR ABSENCE OF A HAZARDOUS MATERIAL OR SUBSTANCE AT LEVELS ABOVE AN AVAILABLE DETECTION OR QUANTIFICATION LEVEL.

TO ASSIST WITH DETERMINING THE AREA OF IMPACT DUE TO A HAZARDOUS MATERIAL RELEASE. (I.E., HORIZONTAL AND LATERIAL EXTENT).

TO BE COMPARED TO WITH SITE-SPECIFIC ACTION LEVELS OR RISK-BASED ACTION LEVELS (E.G., EPA PRGS) TO ASSIST IN DETERMINATION IF HEALTH THREATS EXIST.

AS DEFINITIVE CONFIRMATORY DATA FOR CONFIRMATION OF NON-DEFINITIVE (SCREENING) DATA.

OTHER: TO PROVIDE EVIDENCE OF AN IMMINENT AND SUBSTANTIAL ENDANGERMENT PURSUANT TO THE NCP.

THE DATA ARE USABLE FOR THE ABOVE OBJECTIVE.

### 12. DOCUMENTATION OF LABORATORY CORRECTIVE ACTION

**Problem:** No problems requiring corrective action were found.

**Resolution:** Not required.

Attached are copies of all data summary sheets, with data qualifiers indicated, and a copy of the chain of custody for the samples.
