Subject: **Final Trip Report for Jay-Cee Cleaners Site**
EPA Contract No. EP-S3-05-02
Technical Direction Document No. E23-014-07-09-004
Document Tracking No. 0413

Dear Mr. Richardson:

Tetra Tech EM Inc. (Tetra Tech) is submitting the final trip report for the Jay-Cee Cleaners Site that summarizes the groundwater sampling activities conducted in September and October 2007. If you have any questions regarding this report, please contact me by phone at (215) 651-4022 or via electronic mail at jordan.vaughn@ttemi.com.

Sincerely,

A handwritten signature in black ink, appearing to read "Jordan Vaughn".

1.0 INTRODUCTION

Under Eastern Area Superfund Technical Assessment and Response Team (START) Contract No. EP-S3-05-02, Technical Direction Document (TDD) No. E23-014-07-09-004, U.S. Environmental Protection Agency (EPA) Region 3 tasked Tetra Tech EM Inc., (Tetra Tech) to collect groundwater samples from residential wells in the vicinity of the Jay-Cee Cleaners located in the City of Nelsonia, Accomack County, Virginia. The purpose of this sampling event is to determine whether the residential wells located in the vicinity of the Site contain hazardous substances. All activities during this sampling event are included in this report.

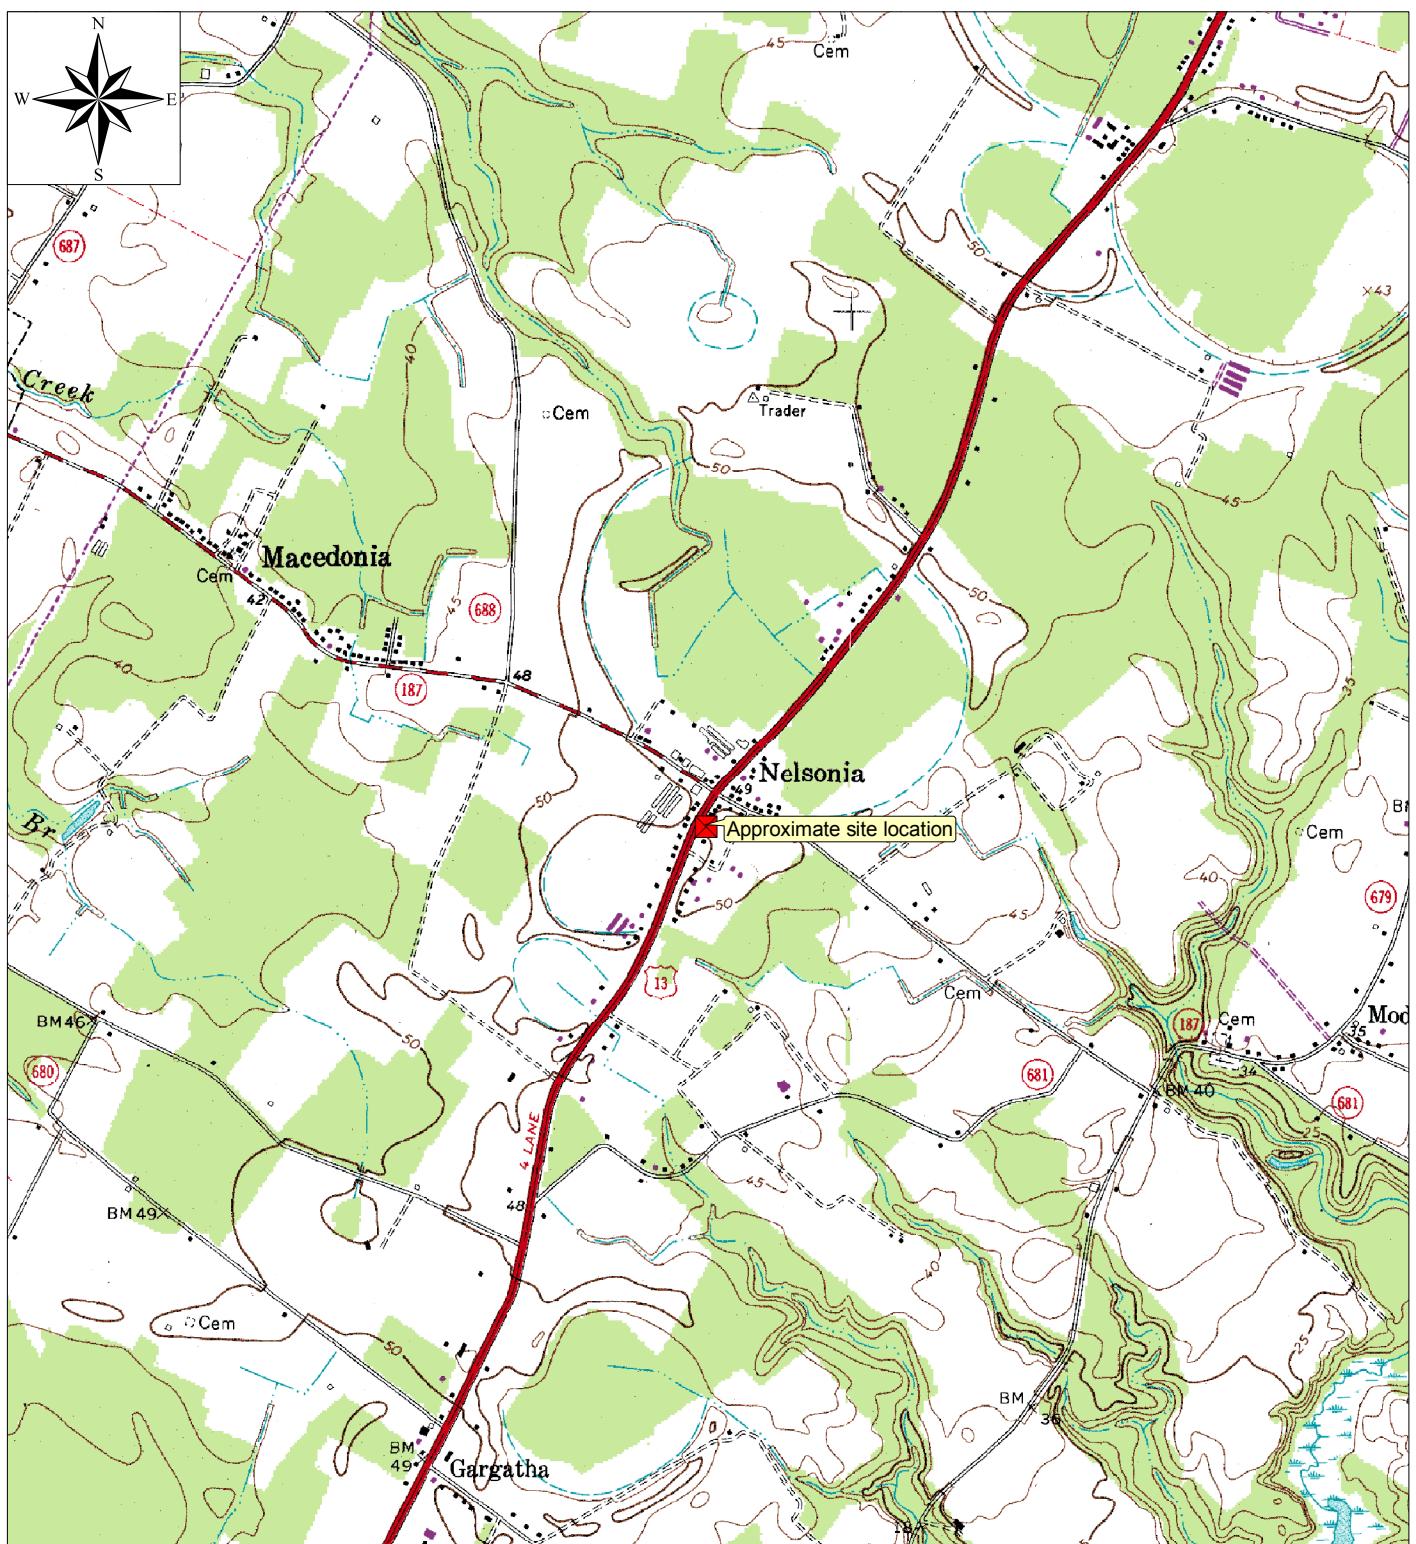

This trip report provides site background information in Section 2.0, describes geology and hydrogeology in Section 3.0, describes site activities in Section 4.0, summarizes analytical results in Section 5.0, and presents conclusions in Section 6.0. References cited in this report are listed in Section 7.0.

2.0 BACKGROUND

This section provides background information on the site, including its location, description, and history of site activities and investigations.

2.1 SITE LOCATION

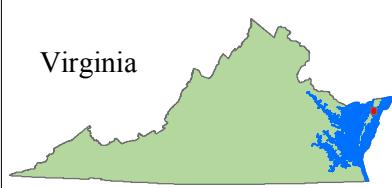

Jay-Cee Cleaners is located at 16163 Lankford Highway, approximately 300 feet south of the intersection of Lankford Highway (US Route 13) and Nelsonia Road (State Road 187), in the City of Nelsonia, Accomack County, Virginia. The geographic coordinates of the approximate center of the Site are latitude 37.8186 north and longitude 75.5883 west (U.S. Geological Survey [USGS] 1965). A Site Location Map is provided as Figure 1.

2.2 SITE DESCRIPTION

The Jay-Cee Cleaners Site (Site) is an approximately 1.1-acre parcel of land with an approximately 3,000-square-foot, single-story structure located at the center of the property (ECS Mid-Atlantic, LLC [ECS] 2007). The Site operated as a dry cleaner from approximately 1957 to 2003 and is currently unoccupied (ECS 2007). The Site is located at approximately 50 feet above mean sea level and slopes gently to the southwest (USGS 1965).

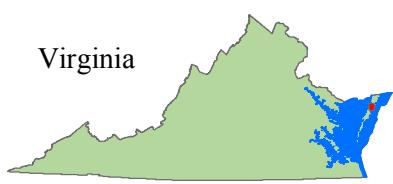

Jay-Cee Cleaners is located in a mixed commercial and residential area. Nearby commercial properties include the Royal Farm convenience store and gas station, located immediately northeast of the Site, and Complete Auto vehicle maintenance and repair shop, located immediately south of the Site. Nearby residential properties are located along Lankford Highway, Nelsonia Road, and Leigh Street. The surrounding area consists of additional residential properties, agricultural land, and woodland. Figure 2, Site Layout Map, shows the location of Jay-Cee Cleaners, local streets, and nearby commercial properties.

2.3 PREVIOUS SITE INVESTIGATIONS

In April 2007, a Phase II Environmental Site Assessment (ESA) was completed by ECS for the Jay-Cee Cleaners property. During the ESA, 11 soil borings were completed to maximum depths of between 4.0 and 8.0 feet below ground surface (bgs) at various locations of concern throughout the property. Soil samples collected from three of the borings were analyzed for volatile organic compounds (VOCs); groundwater samples were collected from two of the borings and also analyzed for VOCs. Soil sample analytical results showed elevated concentrations of tetrachloroethene (PCE) and several PCE-related compounds, including *cis*-1,2-dichloroethene (DCE) and trichloroethene (TCE). The maximum concentrations of PCE, DCE, and TCE in the soil were 9,200 milligrams per kilogram (mg/kg), 36 mg/kg, and 100 mg/kg, respectively. Both groundwater sample results showed elevated concentrations of PCE and PCE-related compounds, including DCE and TCE. The maximum concentrations of PCE, DCE, and TCE in groundwater were 100,000 micrograms per liter ($\mu\text{g}/\text{L}$), 52,000 $\mu\text{g}/\text{L}$, and 6,300 $\mu\text{g}/\text{L}$, respectively.

TETRA TECH

Following completion and review of the ESA, the Virginia Department of Environmental Quality (VA DEQ) was notified of the elevated VOC concentrations. VA DEQ, in turn, notified EPA of the elevated concentrations. In September 2007, EPA tasked Tetra Tech with collecting groundwater samples from the nearby residences for VOC analysis.

3.0 GEOLOGY AND HYDROGEOLOGY

This section discusses the local geology and hydrogeology at the site.

3.1 GEOLOGY

The Site is located in the Coastal Plain physiographic province of Virginia. The Virginia Coastal Plain consists of a wedge of generally unconsolidated Jurassic and younger sediments increasing in thickness from nearly 0 feet in the east where the Coastal Plain bounds the Piedmont physiographic province to more than 6,000 feet beneath the northeastern part of the Eastern Shore Peninsula (Meng and Harsh 1988). The sediments consist of Jurassic and Cretaceous clay, sand, and gravel overlain by a thin sequence of Tertiary marine sands overlain by Quaternary sand, mud, and gravel (Bailey 1999). In Virginia, the Coastal Plain is dissected by the Chesapeake Bay, which was created approximately 5000 to 6000 years ago when the lower course of the Susquehanna River was flooded by rising sea level (Hobbs 2004).

The Site is directly underlain by Quaternary Columbia Group sediments (Cedarstrom 1957). The sediments can generally be characterized as unconsolidated fining-upwards depositional sequences of gravels, sands, and silts and clays (Meng and Harsh 1988). The sediments were deposited in fluvial-deltaic and estuarine settings similar to those that exist in the modern Chesapeake Bay and its tidal tributaries (Meng and Harsh 1988, Bailey 1999).

3.2 HYDROGEOLOGY

Sediments of the Coastal Plain physiographic province are classified into a series of 19 hydrogeologic units designated as aquifers or confining zones (Meng and Harsh 1988,

McFarland and Bruce 2006). The uppermost aquifer is the unconfined surficial aquifer (also called the Columbia aquifer), which is composed of unconsolidated interbedded gravels, sands, and silts and clays (Meng and Harsh 1988, McFarland and Bruce 2006). The surficial aquifer is moderately to widely used for private domestic wells (McFarland and Bruce 2006). The aquifer is principally recharged by precipitation infiltration. Due to the stratified nature of the sediments, horizontal hydraulic conductivity is generally greater than vertical hydraulic conductivity, and most of the unconfined groundwater flows relatively short distances before discharging to nearby streams and water bodies (McFarland and Bruce 2006). A small amount, however, reaches deeper, confined aquifers. In the area of Jay-Cee Cleaners, the surficial aquifer is underlain by the Yorktown confining zone (Meng and Harsh 1988, McFarland and Bruce 2006). It consists of finer grained sediments and is generally tens of feet thick (McFarland and Bruce 2006). The Yorktown confining zone is underlain by the Yorktown-Eastover aquifer, which is composed of thick to massively bedded shelly sands and lesser clay intervals (Meng and Harsh 1988, McFarland and Bruce 2006). The Yorktown-Eastover aquifer is used for both commercial and private domestic water supply wells.

Well logs located in the vicinity of the Site and described by Meng and Harsh (1988) indicate that the surficial aquifer in the vicinity of the Site extends from ground surface to between 64 and 66 feet bgs. The well logs indicate a thickness for the Yorktown confining zone of between 60 and 74 feet (from between 64 and 66 feet bgs to between 124 and 140 feet bgs). The described wells are completed in the Yorktown-Eastover aquifer and, based on well total depths, indicate that the aquifer extends from the base of the Yorktown confining zone to greater than 340 feet bgs.

Shallow borings completed on the Jay-Cee Cleaners property as part of the April 2007 ESA encountered surficial groundwater at approximately 6 feet bgs (ECS 2007). Based on topography, surficial groundwater flow direction is expected to be to the southeast (USGS 1965).

4.0 SITE ACTIVITIES

Sampling activities occurred in September and October 2007.

4.1 SAMPLING SUMMARY

On September 27, 2007, Tetra Tech mobilized to the Site with EPA personnel to sample residential wells located near the Jay-Cee Cleaners property. Sampled residences were located on Lankford Highway, Nelsonia Road, and Lehigh Street and are shown on Figure 3, Sampling Location Map. Locations were determined by proximity to Jay-Cee Cleaners and by permitted access. Samples collected on September 27, 2007, arrived at the analytical laboratory above acceptable temperatures. As a result, Tetra Tech, accompanied by VA DEQ personnel, returned to the Site on October 4, 2007, and collected a duplicate sample set. A total of seven residences were sampled; 1 duplicate sample and 1 field blank were collected. All residential water supply samples were collected from outside sources prior to any treatment systems. All water systems were flushed for 15 minutes before samples were collected. Table 1 summarizes the November 4, 2007 sample collection activities, including sample identifiers, laboratory identifiers, matrix, sample date, collection time, analysis, and additional comments.

TETRA TECH

Tetra Tech photographed and logged documentation at the site in accordance with Tetra Tech Standard Operating Procedure (SOP) No. 024, “Recording of Notes in Field Logbook” (Tetra Tech 1999). Photographic documentation is in Appendix A.

4.2 SAMPLE MANAGEMENT

Samples were handled and packaged in accordance with the Tetra Tech SOP No. 019, “Packaging and Shipping Samples” (Tetra Tech 2000) and with the Tetra Tech “Quality Assurance Project Plan (QAPP) for START” (Tetra Tech 2006). All shipping containers were properly labeled with EPA custody seals and were delivered with signed chain-of-custody forms and appropriate hazard warnings for laboratory personnel. Samples were submitted under DAS Number R32830.

5.0 ANALYTICAL RESULTS

This section summarizes analytical results for the groundwater samples collected during the Jay-Cee Cleaners October 2007 sampling event.

All samples were analyzed by the EPA Region 3 Environmental Science Center Office of Analytical Services and Quality Assurance laboratory in Fort Meade, Maryland. Data were qualified as part of the laboratory quality control. Concentrations for the following analytes were qualified as “B” and “J” because levels of these were not substantially above those reported in the field blank, and because reported values were estimated: acetone in samples JCC-RW-01R, JCC-RW-02R, JCC-RW-04R, JCC-RW-05R, JCC-RW-06R, JCC-RW-07R, and JCC-RW-08R; and toluene in sample JCC-RW-03R. Concentrations of the following analytes were reported as estimates and therefore qualified as “J”: TCE in sample JCC-RW-01R; carbon disulfide, chloroethane, and PCE in sample JCC-RW-02R; 1,2,3-trimethylbenzene in sample JCC-RW-03R; carbon disulfide in sample JCC-RW-04R; chloroform in sample JCC-RW-06R; and TCE in sample JCC-RW-08R. Acetone, ethylbenzene, naphthalene, toluene, and m-xylene/p-xylene were detected in the trip blank, JCC-TB-01R; all analytes detected in JCC-TB-01R were reported as estimates and were therefore qualified as “J.”

Tetra Tech compared the groundwater analytical data to EPA maximum contamination limits (MCL), the maximum contaminant levels permitted in public drinking water, and to EPA risk-based concentrations (RBC), established concentrations at which contaminants may be harmful. None of the collected samples had concentrations exceeding EPA MCLs. However, three samples (two samples collected from separate residences and one duplicate sample) had concentrations greater than the EPA RBCs. PCE concentrations in JCC-RW-01R, JCC-RW-02R, and JCC-RW-08R (the duplicate of JCC-RW-01R) were 0.6 µg/L, 0.2 µg/L, and 0.5 µg/L, respectively exceeding the RBC for PCE of 0.1 µg/L. TCE concentrations in JCC-RW-01R and its duplicate sample JCC-RW-08R were both 0.06 µg/L exceeding the RBC for TCE of 0.026 µg/L. A summary of detected analytical results is provided in Appendix B. A copy of the final analytical results is provided in the Attachment to this report.

6.0 CONCLUSIONS

Tetra Tech collected groundwater samples from seven residential properties located near the Site in the City of Nelsonia, Accomack County, Virginia. A duplicate sample from one of the residential properties was collected and a trip blank was also included in the samples sent for analysis. All samples were analyzed for VOCs. Analytical results indicated that all samples were below EPA MCLs. However, analytical results from three of the samples (two from separate residences and one duplicate sample) indicated concentrations of PCE and/or TCE above EPA RBCs.

Based on the presence of PCE and/or TCE in two residential wells, Tetra Tech recommends continued investigation of the Site. Tetra Tech recommends an assessment of the Jay-Cee Cleaners property to determine the nature and extent of on-site contamination. Tetra Tech also recommends conducting a hydrogeologic study of the Site vicinity to further define the extent and potential migratory pathways of contaminants. Additionally, Tetra Tech recommends attempting to obtain well drilling and completion information from the nearby residential properties. This information could indicate whether residential wells are completed in the unconsolidated surficial aquifer or the underlying confined Yorktown-Eastover aquifer, and

would provide additional information regarding the extent of contamination. Finally, Tetra Tech recommends a follow up sampling event to determine whether or not contaminant concentrations are remaining stable.

Notes and Definitions

- J The identification of the analyte is acceptable; the reported value is an estimate.
- B Not detected substantially above (10 times) the level reported in the laboratory or field blanks (including field, trip, rinsate, and equipment blanks).
- A Quality control value is outside acceptance limits.
- NR Not Reported
- RPD Relative Percent Difference
- U Analyte included in the analysis, but not detected at or above the quantitation limit.

Quantitation Limit: The lowest concentration of an analyte that can be reliably measured within specified limits of precision and accuracy for a specific laboratory analytical method and that takes into account analytical adjustments made during sample preparation and analysis.

SOLID SAMPLE RESULTS - REPORTING PROTOCOL: Solid samples where % Solids (percent dry wt at 105 degrees C) has been performed, are analyzed wet and converted to a dry weight result for reporting purposes. This is routine for organics and most inorganic analyses. When metals and mercury analyses are requested, solid samples are routinely analyzed and reported on a dry weight basis. Solid samples for metals/mercury are prepared for analysis by an initial drying at 60 degree C and homogenization before digestion. Oil-type samples will be analyzed and reported on a wet weight basis for all analyses because of the nature of the sample. Any exceptions to the protocol will be noted with a qualifier
