Subject:

Monthly Settlement Monitoring Report for the Waste Slope in the Vicinity of Gas Extraction Well W-135, Rumpke Sanitary Landfill, Inc.

Environmental

Dear Mr. Butler:

Date:
March 12, 2010

ARCADIS is pleased to present the report presenting the results of the settlement monitoring surveys in the vicinity of gas extraction well W-135 at the Rumpke Sanitary Landfill, Inc. (Rumpke) facility in Hamilton County, Ohio. This report presents the data obtained from the topographic and movement monitoring surveys performed on February 26, 2010 and March 9, 2010.

OBSERVED SETTLEMENT

Tecumseh Surveying performed the monthly topographic survey on February 26, 2010. Figure 1 presents the existing topography developed by merging the ground survey of February 26, 2010 with the aerial topographic survey of November 28, 2009. The surveyors recorded the ground elevation at random points, and along obvious slope breaks (toe of slope, flow-line and crest of bench, etc.). These data were then input into AutoCAD Civil3D software. The software is then used to generate a 3-dimensional surface representing the ground topography by triangulating between the surveyed points. The software then generated the contours shown. It should be noted that some variation will occur between surveys of irregular slopes due to variations in locations of the surveyed points used to develop the surfaces, even when there is no significant change in elevation between the surveys. These variations are most significant near changes in slope angle or direction.

Settlement

Figure 2 presents the settlement calculated between the topography based on the ground survey of January 29, 2010 (by Rumpke) and the topography based on the ground survey of February 26, 2010. These data indicate that there has been up to

Imagine the result

4.5 feet of settlement between January 29, 2010 and February 26, 2010. Some increase in elevation is shown, primarily below the existing bench, of up to 3.3 feet during this same time period. Most of this difference can be attributed to on-going maintenance work at the site. Some of the apparent settlement or rise can also be attributed to the precision of the surveys and to the manner in which the modeling software interprets contour between surveyed points.

Figure 3 presents the annualized settlement rate between January 29, 2010 and February 26, 2010 expressed as a percentage of the original waste thickness. To develop this data, it was necessary to evaluate the settlement at specific points. In this case, the survey points that Rumpke used during the initial slope monitoring surveys for this project were utilized. They do not necessarily correlate to specific points from the recent ground surveys.

For each of the points shown on Figure 3, the initial waste depth was established by sampling the as-built top of liner surface (developed from the as-built certification surveys) and the ground elevations based on the October 31, 2008 aerial topographic survey. Then, for each point, the ground surface for each survey date was sampled. Once these data were collected and tabulated, the annualized settlement, expressed as a percentage of the original waste thickness, was calculated for each point as follows:

- Step 1 – Calculate settlement (ft) for the period being evaluated.
- Step 2 – Calculate the daily rate of settlement (ft/day) by dividing the settlement (ft) by the number of days (day) in the period.
- Step 3 – Calculate the annualized rate of settlement (ft/yr) by multiplying the daily settlement rate (ft/day) by 365 days/yr.
- Step 4 – Divide the annualized settlement rate (ft/yr) by the initial waste thickness (ft) at the point and report as a percentage of original waste thickness (%/yr).

As discussed above, some of the calculated settlement is attributable to variations inherent in the generation of the surface models, particularly where there are changes in slope. These changes are amplified when expressed as an annualized settlement rate as a percentage of waste thickness. These changes are further amplified for points with a lower initial waste thickness.

Some of the apparently large settlement rates at the edges of the isopach, particularly at the north-east corner, the middle portion of the east slope and the south-west corner of the survey area are due to the proximity of these points to slope breaks and irregularities of the contours (corners). The magnitude of the annualized settlement rates in these areas are magnified because the initial waste thickness (approximately 50 feet) is relatively thin in these areas. Therefore, it is our opinion that the relatively high annualized settlement rates in these areas are not representative of an expansion of the active reaction area.

Lateral Movement

Lateral movement of the slope is being monitored at several points in the area of concern (Figure 4). At each of these locations a survey hub was driven into the ground, and the top of the stake was surveyed. These hubs have generally been surveyed on a bi-weekly basis. A summary of the survey data to date is presented on Tables 1 and 2.

The overall rate for horizontal displacement from points 203 – 205 (those historically exhibiting the most movement) was approximately 0.85 inches/day from 2-4-10 through 3-9-10. This rate is lower than recent periods.

Vertical movement has reduced, with mostly downward movement from 2-4-10 through 3-9-10. The observed vertical movement ranged from +0.22 feet to -0.48 feet for these points.

For the higher-numbered points, past evaluations have focused on points within the primary settlement area: 536, 567, 656, 674, 703 and 839. The overall horizontal displacement rate for these points averaged 0.56 inches/day from 2-4-10 through 3-9-10. Settlement at these points ranged from -0.81 feet to -4.13 feet.

Please note that points 200, and 206 through 209 were buried by the initial buttress construction and therefore not included in this survey. They were replaced by points 212 though 216.

CLOSING

ARCADIS appreciates the opportunity to provide this geotechnical evaluation.
Should you have any questions or require additional information, please feel free to
contact us at (513)860-8700.

Sincerely,

John W. Holm, P.E.
Senior Engineer

Note: Total movement since 12-22-09 is calculated by comparing the current day survey to the survey on 12/22/09.

Note: Total movement since 10-25-09 is calculated by adding the total movement between the survey date and 12/22/09 to the total movement from 10-25-09 through 12-17-09 (Table 1A). Movement between 12-17-09 and 12-22-09 was not monitored for these points.

Avg. 203-205 0.60 0.65 5.42 0.85 7.23 0.78

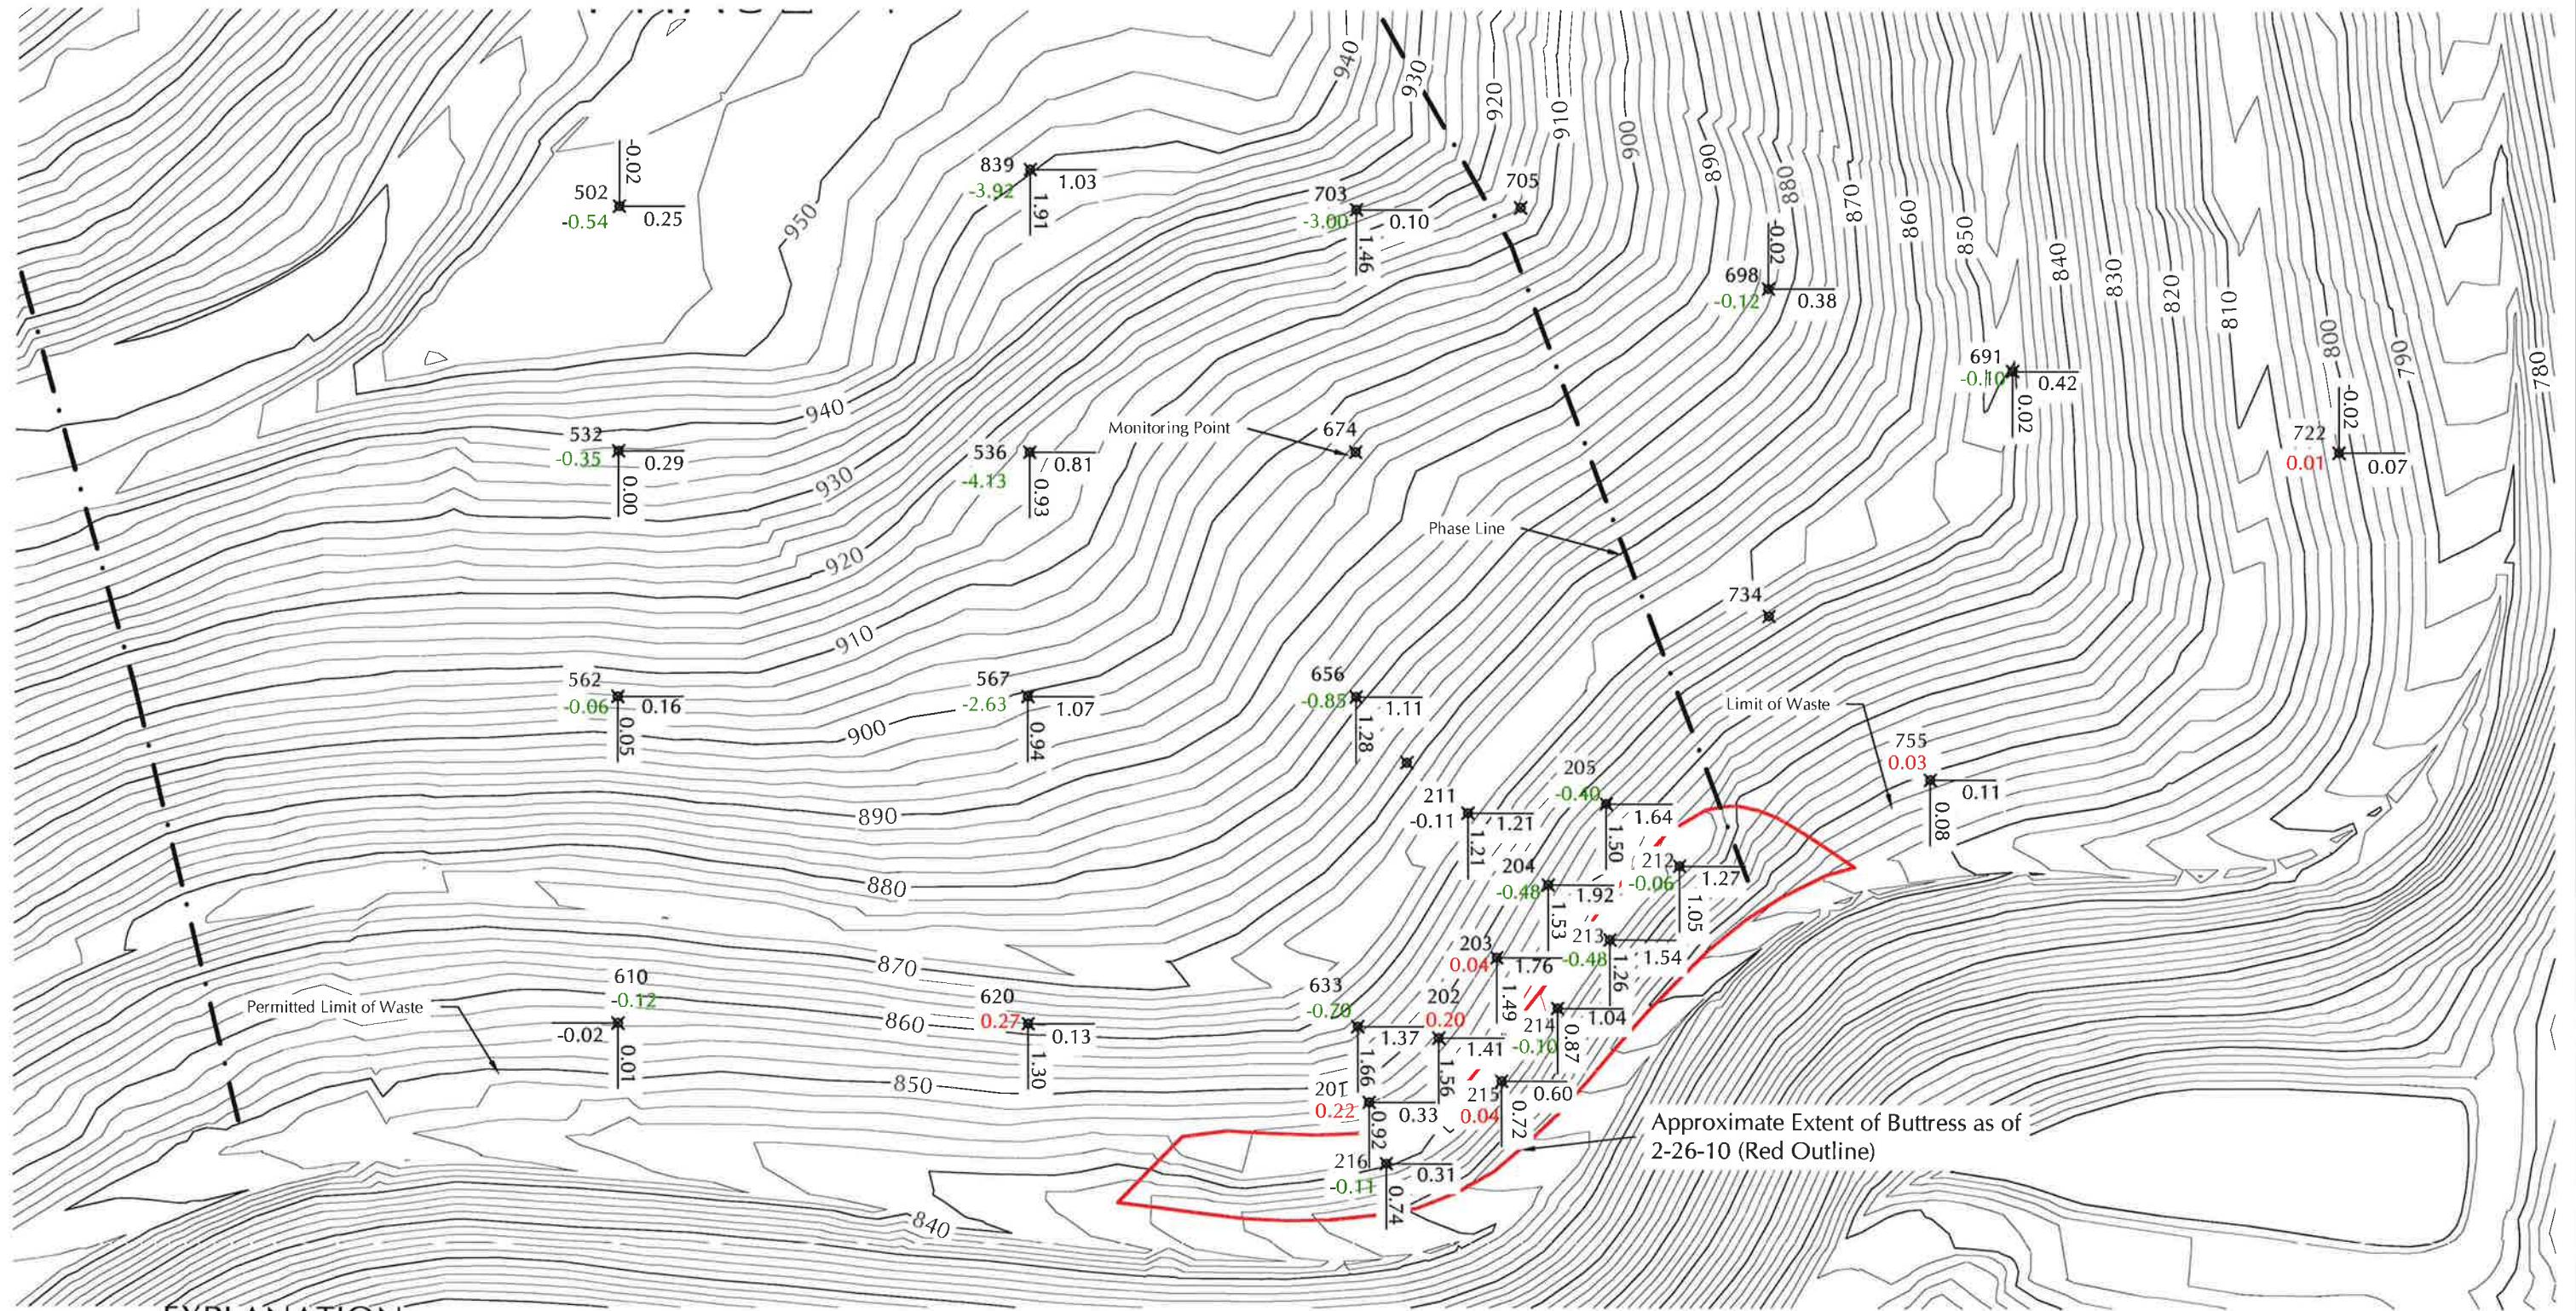

Note: Total movement since 12-22-09 is calculated by comparing the current day survey to the survey on 12/22/09.

Note: Total movement since 11-17-09 is calculated by adding the total movement between the survey date and 12/22/09 to the total movement from 11-17-09 through 12-21-09 (Table 2A).

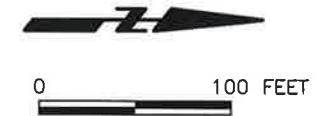

EXPLANATION

- Point Number
- Monitoring Point
- Total Horizontal Movement From 2-26-10 through 3-9-10
- Magnitude (feet) and Direction. Arrow scaled 50X actual movement.
- Elevation Change From 2-26-10 through 3-9-10
- Green** = Negative (Settlement), **Red** = Positive (Rise).

Note:

Displacements shown on this figure are the total lateral displacement between February 26, 2010 and March 9, 2010. Topography shown is a composite of the ground survey of 2-26-10 and the aerial topography of 11-28-09.
