1.0 INTRODUCTION

TechLaw was tasked by the U.S. Environmental Protection Agency (EPA) Region III On-Scene Coordinator (OSC) to conduct a Removal Assessment at the Weirton BOP Implosion site (Site) located in Weirton, Hancock County, West Virginia. On-site investigation activities were conducted during November 2019 and February 2020. These activities included an initial Site reconnaissance followed by surface soil sampling conducted in accordance with the approved Sampling QA/QC Work Plan (SQAP) dated January 23, 2020 (TechLaw, 2020). This report provides a summary of the Site reconnaissance and sampling investigation activities and associated laboratory analytical results. The sampling activities were conducted by TechLaw under EPA Superfund Technical Assessment and Response Team (START) – West contract EP-S3-15-03, Technical Direction Document (TDD) No. T501-19-11-001.

2.0 SITE DESCRIPTION

The Site comprises the residential and commercial properties to the north, east and south of the former Basic Oxygen Plant (BOP) located on the Frontier, Mingo Junction Steel Works, LLC property in Weirton, WV. Prior to its implosion, the BOP was a large structure situated on a 16.4-acre parcel of land that was located approximately 1000 feet south-southeast from the intersection of WV State Route 2 (SR2) and Pennsylvania Avenue (SR105) in Weirton, WV. The BOP location is bound to the north by Terrace Circle, to the east by residential homes along Weir Avenue, to the south by the Steel Works facility, and to the west by SR2. Coordinates for the approximate center of the BOP facility are 40.414848 degrees (°)north latitude and -80.587102° west longitude (Google Earth Pro© - refer to Figure 1, Site Location Map and Figure 2, Site Aerial Map).

On March 9, 2019, the final phase of the BOP demolition project was conducted by the owner who had the remaining structure demolished by means of a scheduled implosion. The implosion caused a large dust cloud and resulted in deposition of particulate matter on nearby residential and commercial properties to the east. Evaluation of surface soil on these off-site properties was the primary objective of this investigation. The BOP location and the approximate investigation area are depicted in Figure 2, Site Aerial Map. The area evaluated consists primarily of residential properties and some mixed-use commercial properties located adjacent to and north and east of the BOP, and which is along and in the vicinity of Weir Avenue and Pennsylvania Avenue. Several background samples were collected to the northwest, southwest and south of the BOP to establish attribution of contaminants where the potential for multiple contaminant contributors may exist.

The former BOP facility is located on a broad, relatively flat valley floor that was a former channel of the Ohio River. The investigation area is upslope from the BOP facility and approximately 25-100 feet higher elevation. The elevation of the valley floor is approximately 730 feet above mean sea level (amsl). The upland areas bounding the east and west sides of the valley are approximately 1170 feet amsl. Steeply sloped stream-dissected hillsides are present throughout the area and are indicative of the topography of the Allegheny Plateau zone of the Appalachian Plateau region.

3.0 BACKGROUND

The basic oxygen steel making process is a method of primary steel-making where carbon-rich pig iron is made into steel. The process of blowing oxygen through the pig iron lowers the carbon content within the iron and changes it to low-carbon steel. The process is known as basic, from the fluxes of burnt lime or dolomite chemical bases, which are added to aid with the removal of impurities and protect the converter lining.

Refer to the *Preliminary Investigation Report Corrective Action Area VI Iron-Making And Corrective Action Area VII Steel-Making*, (Preliminary Investigation Report) prepared by Civil and Environmental Consultants, Inc. (CEC, 2015) for a presentation of historical Site ownership and previous investigations of the Site. The CEC report figures referencing locations of solid waste management units (SWMUs) and areas of concern (AOCs) were unavailable during the background file review. SWMUs described in the Preliminary Investigation Report include the former yard office locomotive fueling station (W-700), detinning plant (W-1000, 1002, and 1007), sludge transfer station (W-1000), and air compressor condensate drip at detinning plant (W-1007).

Weirton Steel Corporation (WSC) received an initial administrative order, on September 16, 1996, under section 3008(h) of the Resource Conservation and Recovery Act (RCRA) from EPA to perform RCRA corrective actions at WSC's steel manufacturing facility located in Weirton, WV. The order became final on October 16, 1996 and specified that WSC perform a RCRA Facility Investigation (RFI). Following several revised submissions, WSC submitted a facility-wide RFI Work Plan to EPA that was approved on July 20, 1999. The RFI Work Plan divided the large complex site (1,390 acres) into 12 Corrective Action Areas (CAAs) to implement the RFI and corrective actions. The BOP building is located in CAA VII as indicated in the CEC Preliminary Investigation Report.

The Weirton BOP was operated by WSC prior to May 17, 2004 when International Steel Group, Inc. (ISG) purchased the majority of WSC's assets including the parcels that made up CAA VI (Iron-Making Area) and VII (Steel-Making Area) which included the BOP. Operations began at the facility on May 18, 2004 under the name of ISG Weirton, Inc., as a subsidiary of ISG. In April 2005, Mittal Steel N.V. (Mittal) acquired ISG. In 2006, Mittal merged with Arcelor to form ArcelorMittal, Inc. From 2006 to 2012, the facility was operated by ArcelorMittal Weirton, Inc., a subsidiary of ArcelorMittal USA, Inc. On December 31, 2012, ArcelorMittal Weirton, Inc. converted to a limited liability company and the name was changed to ArcelorMittal Weirton LLC (CEC 2015).

The RFI Work Plan for CAAs VI and VII was submitted to the U.S. EPA on June 26, 2013. A revised work plan was approved by EPA on September 19, 2013. CEC conducted field investigations from October to December 2013. A total of 17 soil borings (SBs) were installed in CAAs VI and VII. One SB was installed in CAA VI. Sixteen SBs were installed in CAA VII. A total of 9 groundwater monitoring wells (GMWs) were installed in CAAs VI and VII. These included three GMWs that were installed in CAA VI and six GMWs that were installed in CAA VII.

CEC indicated that the constituents of potential concern (COPCs), related to the (SWMUs and AOCs identified in the Preliminary Investigation Report, include volatile organic compounds (VOCs), primarily monocyclic aromatic hydrocarbons and halogenated aliphatics; semi-volatile

organic compounds (SVOCs), primarily phenols and polynuclear aromatic hydrocarbons (PAHs); polychlorinated biphenyl (PCBs); metals; and cyanide (CEC 2015). Results from the preliminary investigation were compared with the residential and industrial EPA Regional Screening Levels (RSLs) for soil that were current at the time of the CEC report (January 2015). Surface soil was compared to the RSL for residential soil based on a future redevelopment scenario. Subsurface soil was compared to the RSL for industrial soil.

Surface soil samples collected as part of the CEC Preliminary Site Investigation conducted in 2015 were analyzed for select VOCs and SVOCs, including 17 (PAHs) and Target Analyte List (TAL) Metals plus cyanide, and PCBs. Analytical results indicated there were no VOCs detected in surface soil samples that exceeded the residential RSLs for soils.

The CEC Preliminary Investigation Report indicates at least seven surface soil sample locations are associated with the BOP building area. The sample identifiers (IDs) are VII-SS-11, 12, 13, 18, 19, 20 and 21. These sample locations are described in Table 5-1 of the CEC Preliminary Investigation Report. The COCs identified in the report as exceeding the RSL for residential soil (surface soil) include PAHs and metals as follows:

- Benzo(a)anthracene with analytical results ranging from 0.013 milligrams per kilogram (mg/kg) to 0.17 mg/kg. Two of the seven samples exceeded the residential soil RSL of 0.15 mg/kg;
- Benzo(a)pyrene with analytical results ranging from 0.0082 mg/kg to 0.18 mg/kg. Six of the seven samples exceeded the residential soil RSL of 0.015 mg/kg;
- Benzo(b)flouranthene with analytical results ranging from 0.013 mg/kg to 0.2 mg/kg. Two of the seven samples exceeded the residential soil RSL of 0.15 mg/kg;
- Dibenz(a,h)anthracene with analytical results ranging from 0.0081 mg/kg to 0.052 mg/kg. Three of the seven samples exceeded the residential soil RSL of 0.015 mg/kg;
- Arsenic with analytical results from 0.75 mg/kg to 5.6 mg/kg. Six samples (SVII-SS-18 was not sampled for TAL metals) exceeded the residential soil RSL of 0.67. Four of the six samples exceeded the industrial soil RSL of 3 mg/kg.

A detailed description of RCRA sampling activities and analytical results can be found in the CEC Preliminary Investigation Report.

More recent activity showed that the BOP parcel was sold to Frontier Industrial Corporation in January 2017. During 2017-2018, an asbestos survey and removal was conducted at the BOP. On June 9, 2018, BOP demolition and teardown began. On March 9, 2019, remaining Sections 14, 15, and 16 of the BOP were demolished via implosion. The implosion caused a large dust cloud that resulted in deposition of particulate matter on nearby residential and commercial properties predominantly to the east of the BOP. On March 11, 2019, a sample of the dust material deposited from the implosion was collected by a chemist and analyzed at a commercial laboratory for inductively coupled plasma-atomic emission spectrometry (ICP-AES) metals, mercury and hexavalent chromium. The results indicated the presence of arsenic, cadmium, lead, and mercury within the dust sample at concentrations of potential concern (Sellitti, 2019). On July 10, 2019, a lawsuit was filed in Hancock County WV Court representing residents of 23 households in Weirton due to alleged hazards and property damage resulting from the implosion.

The West Virginia Department of Environmental Protection (WVDEP) subsequently requested EPA assistance with evaluating surface soils on nearby properties for contaminants of concern related to the implosion.

4.0 INVESTIGATION ACTIVITIES

TechLaw performed the following activities as part of this investigation: prepared a Health and Safety Plan (HASP); conducted a site reconnaissance; developed a geographical information system (GIS) database for the Site; acquired parcel maps; prepared the SQAP; arranged for analytical services; developed a SCRIBE™ database for the Site; conducted a sampling event that included collection of surface soil samples; shipped samples to assigned and/or procured laboratories; managed environmental data; evaluated sample results; and prepared this report.

The following paragraphs summarize the investigation and sampling activities conducted at the Site and provide a brief synopsis of the analytical results. Site and sample location maps, a sample log, data summary tables, chain-of-custody's (COCs), data validation reports and a photolog are attached at the end of this report.

4.1 Site Reconnaissance

On the morning of November 26, 2019, two EPA On-Scene Coordinators and three START personnel held a meeting at the TechLaw office in Wheeling, WV to discuss the project scope, objectives and schedule. Following the meeting, all personnel mobilized to the Site and conducted a Site reconnaissance to evaluate potential sampling locations in the area of interest near the BOP implosion site. The reconnaissance activities included reviewing property parcels identified by EPA based on their proximity to the implosion site and accessibility. The parcels evaluated were owned by the City of Weirton and included open vacant lots, wooded lots, playgrounds, a small park, and a parcel containing a fenced pump house station. Most of these locations were within the residential neighborhood along Weir Avenue east of the BOP that received significant deposition of particulates from the BOP implosion that took place 8.5 months earlier. Video footage of the implosion taken by media outlets and others was readily available on the internet for viewing and showed the large dust cloud envelope the neighborhood on Weir Avenue including the lots identified for potential sampling activities. START took photos and obtained global positioning system (GPS) coordinates at the property locations to support preparation of the SQAP then demobilized from the Site.

4.2 Planning and Pre-Mobilization Activities

During interim planning and SQAP development activities that took place during December 2019 and January 2020, EPA identified 13 additional privately owned lots that were within the Weir Avenue investigation area for sampling purposes. TechLaw provided to the OSC parcel ownership information and parcel maps obtained from the Hancock County Assessor's Office on-line service. This was to assist EPA's efforts with obtaining owner access agreements to conduct the sampling activities. The additionally identified privately owned vacant lots were located in areas directly across from, due east of, and downwind of the BOP implosion location.

A property access agreement for the 13 privately owned parcels was signed by the owner on January 20, 2020. The access agreement for 11 properties owned by the city of Weirton was signed on January 21, 2020.

TechLaw START prepared a Draft SQAP to outline sampling procedures for collecting surface soil samples (TechLaw, 2020). The SQAP specified analytical parameters and project quality control/quality assurance (QA) procedures to be used during the sampling event. TechLaw prepared a draft Analytical Request Form (ARF) and submitted it along with the SQAP to the OSC for review and approval on January 9, 2020. The SQAP was revised to address EPA comments received on January 23, 2020 and TechLaw submitted the final SQAP on the same date to the OSC. The approved SQAP and ARF were submitted to the EPA Region III Office of Analytical Services and Quality Assurance (OASQA) Client Services Team (CST) on January 24, 2020 to arrange for analytical services. The CST scheduled analytical services for the project through the Contract Laboratory Program (CLP) Routine Analytical Services (RAS) and Delivery of Analytical Services (DAS), and requested Tier IV laboratory services be procured by TechLaw for Asbestos analysis. Case numbers and laboratory assignments were provided by the CST to TechLaw on February 5, 2020. TechLaw prepared a scope-of-work (SOW) and request for quote (RFQ) and solicited bids from laboratories capable of performing the asbestos analysis. EMSL Analytical, Inc., Cinnaminson, NJ was subcontracted by TechLaw to conduct the work. The following case numbers, analytical parameters and laboratory assignments were provided to TechLaw by the EPA CST:

1. **CLP Case No. 48747**: For analyses of surface soil samples and a rinsate blank for TAL metals (total) and mercury (Hg). The analyses were assigned by the CST to Bonner Analytical Testing Company, Hattiesburg, MS.
2. **DAS Case No. R35756**: For analysis of surface soil samples and a rinsate blank for hexavalent chromium. The analysis was assigned by the CST to the EPA Region 3 OASQA Laboratory, Fort Meade, MD.
3. **DAS Case No. R35754** (Tier IV): For analyses of surface soil samples for asbestos containing materials (ACMs). TechLaw procured analytical services for asbestos with EMSL Analytical, Inc. – Cinnaminson, NJ Laboratory.

On January 31, 2020, the OSC provided TechLaw with the signed access agreements for properties to be sampled. TechLaw updated sample location parcel maps to include the properties where access was granted. The SCRIBE™ database was prepared to output sample tags, labels, and Chain-of-Custody (COC) records; and to use for data management. TechLaw procured sampling materials and supplies and rented a Trimble® Geo 7X handheld GPS unit to collect coordinates at the sample locations.

During the week of February 17, 2020 and prior to the sampling event, EPA handed out postcards to citizens in the area of the investigation that provided information related to EPA's activities being conducted at the Site and pertinent EPA contact information.

4.3 Field Sampling Activities

On February 19, 2020, prior to mobilization to the Site, TechLaw collected a rinsate blank (RB-01) from the dedicated trowels to be used during the sampling event. The blank sample was collected by pouring deionized ultra-filtered water (DIUF) over the trowels to be used for sampling and collecting the water in sample containers and storing the sample in a cooler on ice. After collection of the rinsate blank, TechLaw START mobilized three personnel to the Site to conduct sampling activities. EPA OSC's Deborah Lindsey and Samantha Holtzinger were

present for the duration of the sampling event.

TechLaw collected a total of 19 biased, discrete (grab) surface soil samples including two duplicate samples from 17 locations on the Site. The sampling locations were on eight City-owned properties and nine privately-owned properties for which access had been granted by the property owners. Three of the locations on City-owned property were selected as background locations (SS-17, SS-18, SS-19). Soil samples were identified as SS-01 through SS-19 and were numbered in the chronological sequence that they were collected. The sample locations are depicted on Figure 3, Sample Location Map.

All surface soil samples were collected from 0-3 inches depth using dedicated stainless steel trowels and in accordance with the procedures outlined in the SQAP. Soil samples were placed in dedicated aluminum pans and thoroughly homogenized. Stones, vegetation and debris were removed prior to filling certified-clean sample containers. Each sample location was photographed and described in the Site logbook. General physical descriptions of the soil were documented. Sample coordinates were collected with the Trimble® GPS data collector. Sample containers were marked with the sample identifier, placed in a plastic zipping bag and stored in a cooler on ice until the samples were processed for shipping. Weather during the event was partly cloudy with temperatures ranging from 26º Fahrenheit (F) in the morning to 39º F in the afternoon. Winds were out of the northwest at 5-10 mph.

Areas of particulate deposition attributed to the BOP implosion dust cloud were not directly observed by the sampling team either on the ground surface at the sampling locations, or on the parcels in general. The lack of observed particulate deposition was likely attributable to weathering over the 8.5 months period between the implosion date and sampling date. Wind, precipitation, infiltration and runoff would be factors contributing to the lack of observed surficial deposition of particulate fallout. The sampling team did observe particulate staining/dust on at least one home structure during the sampling event that could possibly be attributable to the implosion event. Refer to Table 1, Soil Sample Descriptions for sample information including sample locations, location descriptions, sample IDs, CLP sample numbers, sample depths, and general descriptions of the soil.

The sampling team completed sampling activities on February 19, 2020 and all personnel demobilized from the Site. TechLaw returned to their Wheeling, WV office and updated the SCRIBE™ database. Samples were labeled, tagged, packaged and shipped under chain-of-custody to the respective laboratories specified in Section 4.2. The samples were packaged and shipped on ice with the exception of the samples scheduled for asbestos analysis. All samples were shipped on February 20, 2020 to the laboratories via FedEx priority overnight. One cooler containing the samples for metals and mercury analyses was delayed by the courier and arrived at the laboratory on February 24, 2020. TechLaw did not receive notification from the courier that the shipment would be delayed. Regional copies of the chain of custody/traffic reports (COC/TR) for all samples shipped are presented in Attachment 1. Refer to Table 1, Sample Log (attached) which tabulates sample location and description information.

5.0 ANALYTICAL RESULTS

Analytical services for TAL total metals by analytical method ISM02.4 ICP-AES and for mercury by method ISM02.4 were provided by Bonner Analytical Testing Company under EPA

CLP RAS Case number 48747. Analytical services for hexavalent chromium by solid waste analytical method SW3060A/7199A were provided by OASQA under EPA DAS Case number R35756. Analytical services for polarized light microscopy asbestos analysis by analytical method EPA/600/R-93/116were provided by EMSL Analytical, Inc. under Tier IV DAS Case number R35754.

5.1 Data Validation

Independent third party data validation of the analytical data provided through the CLP and the Tier IV laboratories was completed by the EPA Environmental Services Assistance Team (ESAT) contractor. Inorganic data were validated according to the EPA CLP National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017) and applicable EPA Region III modifications. Electronic validation was performed by the Electronic Data eXchange & Evaluation System (EXES). The inorganics validation report has been assigned the Superfund Data Validation Level Stage 3 Validation Electronic Manual (S3VEM). Analytical data for samples analyzed by the EPA OASQA were reviewed and validated in accordance with internal QA/QC requirements.

The Final Report containing validated hexavalent chromium results was received from OASQA on April 15, 2020. The data validation report for metals and mercury was received from ESAT on May 5, 2020. The data validation report for asbestos was received on June 2, 2020. Refer to Attachments 2, 3 and 4 – Data Validation Reports for findings documented during the data validation process.

The data validators sometimes assign qualifiers to data based on a review of the data and quality control parameters. Lists of potential data qualifiers typically used and definitions are provided below.

Glossary of Inorganic Data Qualifier Codes

Validation Qualifiers	In order of descending precedence. Only one of these qualifiers may apply to any result.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
U	The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.
B	The result is presumed a blank contaminant. This qualifier is used for drinking water samples only.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.

5.2 TAL Metals, Mercury and Hexavalent Chromium Results

5.2.1 Comparison To EPA's Removal Management Levels

The inorganic analytical results for surface soil samples were compared to EPA Regional Removal Management Levels (RMLs) for Industrial and Residential soil (Target Hazard Quotient [THQ]=3.0) (EPA, 2019b) and EPA RMLs for Industrial and Residential soil (THQ=1.0) (EPA, 2019b). The RMLs discussed in this report and provided in the attached tables are generic in that they are calculated without using site-specific information. The RMLs assist with identifying areas, contaminants and conditions where a removal action under CERCLA may be appropriate. Other factors such as background concentrations, site-specific exposure scenarios, or other program considerations are also considered when evaluating the appropriateness for conducting removal actions. RMLs are not meant to define protective levels and are not de facto cleanup levels. The generic RMLs correspond to risk levels of approximately 10-4 and/or a Hazard Quotient of up to 3 for long-term exposure to individual chemicals at a site. The generic RML tables provide risk-based values corresponding to an HQ of 1 and 3 for those chemicals with potential non-carcinogenic toxicity as there may be site-specific and/or chemical specific circumstances where an HQ less than 3 may be more appropriate for calculating RMLs. For example, RMLs corresponding to an HQ of 1 may be more appropriate for those sites where multiple chemicals are present that have reference doses (RfDs) or reference concentrations (RfCs) based on the same toxic endpoint or where the toxicity of a chemical is such that exceeding the RfD/RfC, even slightly, warrants particular concern (EPA, 2019b).

Analytical results that exceeded the screening benchmarks are presented in the subsections below. Refer to Table 1, Sample Log and the attached Photo Log for sample locations and descriptions.

5.2.1.1 RML THQ=3 Exceedances

There were two samples that exceeded the RML THQ=3 screening levels for metals in residential soil. Sample SS-05 exceeded the benchmark for lead and sample SS-18 exceeded the benchmark for manganese as further described below.

Lead was detected at a concentration of 485 mg/kg in sample SS-05. The concentration exceeded the residential soil RML benchmark of 400 mg/kg. There were no other samples that exceeded screening level benchmarks for lead.

Manganese was detected at a concentration of 5,510 mg/kg in sample SS-18. The concentration slightly exceeded the residential soil RML THQ=3.0 benchmark concentration of 5,500 mg/kg. Sample SS-18 was a background sample collected from a location approximately 0.75 miles south of the former BOP.

There were no other sample results for metals that exceeded RML THQ=3 benchmarks. Refer to Table 2 for a comparison of the metals data to the RML THQ=3 screening level benchmarks. In the tables, benchmark exceedances are identified by color shading. The color key located in the upper left corner on each table describes the type of benchmark exceedance.

5.2.1.2 RML THQ=1.0 Exceedances

There were eight samples that exceeded the RML THQ=1.0 screening level benchmarks for metals in residential soil. The samples included SS-03, SS-04, SS-05, SS-09, SS-11, SS-17, SS-18 and SS-19 which contained elevated concentrations of arsenic, iron and/or manganese. These samples and the exceedances are further described below.

Only one sample, SS-19, exceeded the RML for arsenic. Arsenic was detected in SS-19 at a concentration of 43.9 mg/kg which exceeded the RML of 35 mg/kg for arsenic in residential soil. SS-19 was collected from a background location approximately 1,800 feet southwest of the former BOP.

Iron was detected in four samples at concentrations that exceeded the residential soil RML benchmark (THQ=1.0) of 55,000 mg/kg. The samples that exceeded the RML included duplicate samples SS-03 (62,700 mg/kg)/SS-04 (64,700 mg/kg) and background samples SS-17 (63,500 mg/kg), and SS-19 (58,500 mg/kg).

Lead was detected at a concentration of 485 mg/kg in sample SS-05 which exceeded the RML of 400 mg/kg.

Manganese was detected at concentrations exceeding the residential soil RML benchmark (THQ=1.0) of 1,800 mg/kg in seven samples. These included duplicate samples SS-03 (4,670 mg/kg)/SS-04 (4,000 mg/kg), SS-09 (2,120 mg/kg), SS-11 (2,340 mg/kg) and background samples SS-17 (1,990 mg/kg), SS-18 (5,510 mg/kg) and SS-19 (1,870 mg/kg).

There were no other metals results that exceeded RML THQ=1.0 benchmarks for residential soil or industrial soil scenarios. Refer to Table 3 for a comparison of the metals results to the RML THQ=1.0 screening level benchmarks.

5.2.2 Comparison to Background Levels

Factors such as background levels, may also be considered in evaluating sample data and the need for further action. Background concentrations can be evaluated as natural background levels or as anthropogenic background levels. Natural background levels refer to elements and compounds that occur naturally in the earth without any human interference. Anthropogenic background levels refer to concentrations of elements and compounds that occur over an area as a result of human activities. The most common example of a naturally occurring background condition is metals in soils. Nearly all soils contain a variety of metal constituents, such as iron, aluminum and lead. These constituents are present in the rocks from which the soils are ultimately derived, and the concentrations can be quite variable and dependent on the specific geologic environment.

In order to compare the analytical data collected as part of this assessment to natural background levels, EPA will use natural background levels that are consistent with Section 3.8.2 of West Virginia's Voluntary Remediation Program Guidance Manual and presented in Table 4. The analytical data from the area in the vicinity of Weir Avenue will also be compared to the three background samples to assess if there are any anthropogenic background levels.

5.2.2.1 Natural Background Levels

All of the soil samples were analyzed for TAL metals which consisted of 23 metals. The laboratory analysis reported no detectable levels of antimony, selenium, silver, sodium, thallium and hexavalent chromium in all sample locations except for SS-01.

A simple comparison of the published natural background levels for West Virginia to the data collected as part of this assessment showed that samples collected did not exceed the natural background levels for aluminum, barium, beryllium, cobalt and potassium.

Thirteen metals including arsenic, cadmium, calcium, copper, iron, lead, magnesium, manganese, mercury, nickel, vanadium and zinc exceeded the published natural background levels. A number of these metals can be associated with the historical industrial operations for the area which may be detected in anthropogenic background levels.

Of the thirteen metals exceeding natural background levels, arsenic, iron, lead and manganese exceeded the RML screening benchmarks.

5.2.2.2 Anthropogenic Background Levels

Three soil samples were selected outside of the implosion plume and collected as site-specific background samples. The locations of the site-specific background samples were non-industrial areas. An average value of the three samples was used in the comparison of Site samples compared to the site-specific background samples.

There were no detectable levels of antimony, selenium, silver, sodium, thallium and hexavalent chromium in the three background locations.

For eleven of the metals, results of the samples collected in the Weir Avenue location were similar to the site-specific background locations including aluminum, cadmium, chromium, cobalt, copper, lead, manganese, mercury, nickel, potassium and vanadium.

Arsenic, barium, beryllium, calcium, iron and magnesium were lower in the Weir Avenue samples compared to the average value for the site-specific background locations

Zinc was higher in the Weir Avenue samples as compared to the site-specific background locations.

5.3 Asbestos Results

The EPA and OSHA consider a material to be asbestos-containing if at least one sample from the homogenous area shows asbestos in an amount greater than 1%. The asbestos results were compared to the 1% concentration standard.

There were no soil samples that contained asbestos fibers at concentrations greater than 1%. Asbestos results for all samples except one were non-detect. In the one sample where asbestos was identified, chrysotile asbestos was observed in sample SS-12 at a trace concentration of <0.25%. Refer to Table 5 for a summary of asbestos results.

5.4 Quality Control Sample Results

As described in Section 4.3, TechLaw collected one rinsate blank (RB-01) from stainless steel

trowels that were decontaminated prior to mobilization and used to collect soil samples during the sampling event. The sample was analyzed for total metals, mercury and hexavalent chromium. All parameters were non-detect and no data were qualified based on the laboratory results. RB-01 laboratory results may be found in the data validation report in Attachment 2.

6.0 SUMMARY

A total of 19 soil samples including two duplicate samples were collected from 17 locations at the Site. The sampling locations included 14 parcels located in the residential and commercial properties near the March 9, 2019 BOP implosion site, plus three additional background locations that were located north, south and southwest of the implosion area. The soil samples were analyzed for TAL Metals, mercury, hexavalent chromium and asbestos content.

Analytical results for the TAL metals, mercury, and hexavalent chromium indicated that lead and manganese exceeded the residential soil RML THQ=3 benchmark. This occurred in samples SS-05 where the lead concentration was 485 mg/kg, and in SS-18 where the manganese concentration was 5,510 mg/kg. Sample SS-05 was collected from a vacant residential lot without structures where residential construction/demolition debris was observed in the surface soil cover. Sample SS-18 was collected from a background location near the perimeter fence line of a community events center.

Arsenic, iron and manganese concentrations in surface soil samples exceeded the RML THQ=1 benchmark for residential soil in eight samples. The RML for arsenic (35 mg/kg) was exceeded in one sample, SS-19, that had a concentration of 43.9 mg/kg. SS-19 was collected from a background location approximately 1,800 feet southwest of the former BOP. Iron was detected in four samples at concentrations exceeding the residential soil RML (THQ=1.0). The samples included SS-03 (62,700 mg/kg)/SS-04 (64,700 mg/kg), SS-17 (63,500 mg/kg), and SS-19 (58,500 mg/kg). Manganese was detected at concentrations exceeding the residential soil RML (THQ=1.0) in seven samples. These included duplicate sample set SS-03 (4,670 mg/kg)/SS-04 (4,000 mg/kg), SS-09 (2,120 mg/kg), SS-11 (2,340 mg/kg), SS-17 (1,990 mg/kg), SS-18 (5,510 mg/kg) and SS-19 (1,870 mg/kg).

Asbestos results were non-detect in all samples except SS-12 which contained a trace level of chrysotile (<0.25%) which is less than the 1% EPA standard for identifying ACM.

A review of the site data compared to background levels was to provide a cursory review to see if levels at the Site could be attributable to naturally occurring metals or anthropogenic conditions. The cursory review showed that concentrations within the Site along Weir Avenue exceed published West Virginia background levels for a number of the metals that are consistent with industrial operations that have been conducted in the area. Comparison of the site data to the site-specific background locations support that the area has metal concentrations which appear to be associated with widespread anthropogenic conditions. A complete background study would need to be conducted to support further conclusions regarding unknown or unconfirmed sources.

7.0 CONCLUSION

EPA was asked by the WVDEP to perform a removal site evaluation on a residential neighborhood adjacent to the Weirton BOP facility to determine if contaminants are present as a

result of the implosion of the BOP structure which took place in March of 2019. EPA's review of the analytical data collected in February 2020 showed concentrations of metals in all of the samples. A small number of samples had levels that exceeded EPA's removal screening benchmarks for soils. Three sample locations exceeded EPA's removal screening levels for iron and manganese, one sample location exceeded for lead and one sample location contained a trace level of asbestos. The background samples outside of the implosion plume contained levels of iron, manganese and arsenic that exceeded removal screening benchmarks. EPA's review of the data showed levels consistent with backgrounds level, both natural occurring and historical, and that a removal action is not warranted.

EPA has coordinated a review of the data with the WVDEP. WVDEP responded that EPA's removal evaluation was satisfactory in the number of samples collected, sample locations provided a broad area to assess potential impact and addressed their request for a more thorough assessment. WVDEP's review of the data did not identify significant exceedances as it related to the WVDEP's RCRA program and would not be pursuing any cleanup of the soils.

EPA has also requested that the Agency for Toxic Substances and Disease Registry (ATSDR) review the data and provide a Public Health Evaluation for the Site. EPA will review any recommendations made by the ATSDR and evaluate if any additional actions can be conducted.

Subject: Inorganic Data Validation (S4VEM)
Weirton BOP Implosion
48747, MC8TR1

Overview

This data package consisted of nineteen (19) soil samples including two field duplicate pairs analyzed for total metals by ICP-AES and for mercury (Hg) by cold vapor atomic absorption technique.

Analysis was performed by Bonner Analytical Testing Company (BON) according to Contract Laboratory Program (CLP) Statement of Work (SOW) ISM02.4.

Data were validated according to the National Functional Guidelines for Inorganic Superfund Methods Data Review and applicable USEPA Region 3 modifications. Electronic validation was performed by the Electronic Data eXchange & Evaluation System (EXES). The validation report has been assigned the Superfund Data Validation Label Stage_3_Validation_Electronic_Manual (S3VEM).

The following validation narrative is an evaluation of laboratory reported data based on the reconciliation electronic data package available through the EXES Data Manager dated March 17, 2020.

Rinsate blank MC0AD1 (analyzed in SDG MCBTR2) was used in evaluating blank contamination for the associated samples in this case based on sampling date.

Summary

No data quality outliers or technical deficiencies were identified that would require rejection of sample results. A matrix spike outlier and blank contamination issues resulted in estimated sample results for several analytes.

Minor Problems

Laboratory instrumentation reported negative values greater than absolute value of the Method Detection Limits (MDL) for thallium (Tl) and Hg in blank analyses. Positive results less than the Contract Required Quantitation Limits (CRQLs) for these analytes have been reported at the CRQL and qualified "UJ". Quantitation limits for these analytes are estimated and qualified "UJ".

The matrix spike recovery was low (<75%) for antimony (Sb) in sample MC0AB2. The post digestion spike recovery was within limits. The quantitation limit for Sb is estimated in this sample and has been qualified "UJ".

Notes

Analytes detected below the CRQLs are estimated and have been qualified "J".

Antimony (Sb), beryllium (Be), cadmium (Cd), cobalt (Co), silver (Ag) and sodium (Na) have been detected in laboratory blanks associated with the sample in this SDG. Concentrations of these analytes which were less than the CRQL have been reported at the CRQL and qualified "U".

No positive results were reported for the associated rinsate blank. No data were qualified based on the rinsate blank.

Laboratory duplicate, serial dilution and Laboratory Control Sample (LCS) analyses reported acceptable results.

The matrix spike recovery was outside control limits for lead (Pb) in sample MC0AB2. The initial concentration for Pb was greater than four times (>4X) the amount of the spike added. No data were qualified.

Concentrations for the following analytes exceeded the calibration range in the initial analysis of samples listed. These samples were reanalyzed at dilution to bring the concentration of the analyte within the calibration range. Results for these analytes are reported from dilution.

Sample	DF	Analyte(s)
MC0AB4	5X	Iron (Fe), Manganese (Mn)
MC0AB5	3X	Fe, Mn
MC0AC2	2X	Mn
MC0AC8, MC0AD0	2X	Fe
MC0AC9	5X	Mn

Results for the field duplicate pairs, samples MC0AB4/MC0AB5 and MC0AC4/MC0AC5, were within ± CRQL, 25% RPD except for calcium (Ca) in duplicate pair MC0AB4/MC0AB5. Data are not qualified based on field duplicate precision. No data were qualified based on this finding.

All Sample numbers in this SDG were previously used by the laboratory in their LIMS as an SDG number. Per the Region, the SDG number for this case was changed to MC8TR1.

Sample calculation checks were performed for several analytes in several samples. All calculated results had RPDs less than 5% of the reported results. No sample data were qualified.

Validation qualifiers are only applied by the validator to field samples. Qualifiers may be applied by EXES electronic validation to laboratory quality control samples.

Glossary of Inorganic Data Qualifier Codes

Validation Qualifiers	In order of descending precedence. Only one of these qualifiers may apply to any result.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
UJ	The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
U	The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit
B	The result is presumed a blank contaminant. This qualifier is used for drinking water samples only.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.

SUBJECT: Region III Data QA Review

FROM: Eric Graybill
Region III ESAT RPO (3LS20)

TO: DEBORAH LINDSEY
Hazardous Site Cleanup Division (HSCD)

Attached is the data validation report for the WEIRTON BOP IMPLOSION SITE site for RAS# 48747; SDG# MC8TR2 completed by the Region III Environmental Services Assistance Team (ESAT) contractor, ICF International, under the direction of Region III LSASD.

If you have any questions regarding this review, please call Eric Graybill at (410)-305-2665.

Subject: Inorganic Data Validation (S4VEM)
Weirton BOP Implosion
48747, MC8TR2

Overview

This data package consisted of one (1) rinsate blank analyzed for total metals by ICP-AES and mercury by cold vapor atomic absorption technique

Analysis was performed by Bonner Analytical Testing Company (BON) according to Contract Laboratory Program (CLP) Statement of Work (SOW) ISM02.4.

Data were validated according to the National Functional Guidelines for Inorganic Superfund Methods Data Review and applicable USEPA Region 3 modifications. Electronic validation was performed by the Electronic Data eXchange & Evaluation System (EXES). The validation report has been assigned the Superfund Data Validation Label Stage_3_Validation_Electronic_Manual (S3VEM).

The following validation narrative is an evaluation of laboratory reported data based on the electronic data package available through the EXES Data Manager dated March 13, 2020.

Summary

No data quality outliers or technical deficiencies were identified that would require rejection of sample results. A blank contamination issue resulted in estimated sample result for mercury.

Minor Problem

Laboratory instrumentation reported negative values for mercury (Hg) greater than absolute value of the Method Detection Limit (MDL) in blank analyses. No positive result was reported for Hg. The quantitation limit for Hg in sample MC0AD1 is estimated and qualified “UJ”.

Notes

No analytes below the Contract Required Quantitation Limits (CRQLs) were detected in this sample.

Aluminum (Al), calcium (Ca), copper (Cu), silver (Ag), thallium (Tl) and zinc (Zn) have been detected in laboratory blanks associated with the sample in this SDG. Concentrations of these analytes which were less than the CRQL have been reported at the CRQL and qualified "U".

Sample number MC0AD1 was previously used by the laboratory in their LIMS as an SDG number. Per the Region, the SDG number for this case was changed to MC8TR2.

As this sample is a field quality control sample, matrix spike, laboratory duplicate, and serial dilution analyses were not performed. No data were qualified based on this finding.

Sample calculation checks were performed for all analytes in sample MC0AD1. All calculated results had RPDs less than 5% of the reported results. No sample data were qualified.

Validation qualifiers are only applied by the validator to field samples. Qualifiers may be applied by EXES electronic validation to laboratory quality control samples.

Glossary of Inorganic Data Qualifier Codes

Validation Qualifiers	In order of descending precedence. Only one of these qualifiers may apply to any result.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
UJ	The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
U	The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit
B	The result is presumed a blank contaminant. This qualifier is used for drinking water samples only.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.

Report Narrative

Aqueous Hexavalent Chromium Analysis Note:

This report contains the results for dissolved hexavalent chromium in water by EPA Method 218.6. This report provides reporting units in ug/L.

Solid Hexavalent Chromium Analysis Note:

Soil samples were analyzed following the On-Demand protocols specified in the EPA Region III LSASD Laboratory Quality Manual and section 6.12 of SOP R3QA069-012320. The samples were digested using SW-846 Method 3060A and analyzed by EPA Method 218.6. This report provides reporting units in ug/g. Slight rounding errors will occur in the Electronic Data Deliverable (EDD).

The soluble and insoluble matrix spikes (BB02604-MS1, BB02604-MS2, BB02604-MS3 and BB02604-MS4) of QC source samples 2002010-01 and 2002010-11 yielded recoveries outside the acceptance limit (< 75%); however, the associated post digestion spikes passed. The pH and Oxidation Reduction Potential of samples 2002010-01 and 2002010-11 were measured and the results indicated that the samples could support hexavalent chromium. Samples 2002010-01, 2002010-11 and associated QCs were re-digested and re-analyzed, however matrix spike recoveries were comparable to the initial analysis. Hexavalent chromium was not detected at or above the quantitation limits in samples 2002010-01 and 2002010-11; therefore, the quantitation limits are qualified as estimated (UJ).

The results for QC source sample 2002010-11 and its associated duplicate sample (BB02604-DUP2) are below the quantitation limit (0.57 ug/g) and the RPD is artificially high (49%). Therefore, the RPD value is qualified as having no significance for this QC data (D).

Site Name: **WEIRTON BOP IMPLOSION SITE** **Project #: DAS R35756**

Notes and Definitions

UJ	The analyte was not detected at or above the quantitation limit. The quantitation limit is an estimate.
D	Source sample result and/or duplicate sample result are below the quantitation limit and the RPD is artificially high. Precision data (RPD value) has no significance for this QC Sample.
A	Quality control value is outside acceptance limits.
%REC	Percent Recovery
RPD	Relative Percent Difference
U	Analyte included in the analysis, but not detected at or above the quantitation limit.
NR	Not Reported

QUANTITATION LIMIT: The lowest concentration of an analyte that can be reliably measured within specified limits of precision and accuracy for a specific laboratory analytical method and that takes into account analytical adjustments made during sample preparation and analysis.

SOLID SAMPLE RESULTS - REPORTING PROTOCOL: Percent Solids (percent dry wt at 105 degrees C) determinations are routinely performed for most organic and inorganic analyses. Consequently, these samples are analyzed wet and converted to a dry weight result for reporting purposes. If metals and mercury analyses are requested, they are routinely prepared for analyses by an initial drying at 60 degrees C, homogenized prior to digestion, and are analyzed and reported on a dry weight basis. Oil-type samples are analyzed and reported on a wet weight basis for all analyses because of the nature of the sample matrix. Any exceptions to this protocol will be noted in the narrative.

ON-DEMAND: The term 'on-demand' analysis, if noted in the report narrative, refers to Section 13.1.4 in the Region III OASQA Laboratory Quality Manual, which provides procedures for non-routine analyses or analytes.

Subject: Inorganic Data Validation (S4VM)
Weirton BOP Implosion
R35754 EMSL04

Overview

This data package consisted of nineteen (19) soil samples, including two (2) field duplicate pairs, analyzed for asbestos utilizing polarized light microscopy (PLM).

Analyses were performed by EMSL Analytical, Inc. (EMSL). The samples were submitted to the laboratory directly by the sampling contractor. The laboratory indicated analyses were performed according to Test Method for the Determination of Asbestos in Bulk Building Materials, EPA/600/R-93/116 July 1993, with milling prep.

Data were validated according to the USEPA PLM Validation Process Guidelines for Asbestos Data Review and with guidance from the National Functional Guidelines for Inorganic Superfund Methods Data Review and are assigned the Superfund Data Validation Label S4VM (Stage_4_Validation_Manual).

The following validation narrative is an evaluation of laboratory reported data based on the electronic data package received by Region 3 on May 7, 2020.

An Electronic Data Deliverable (EDD) was provided by the laboratory. It was protected and could not be modified by the validator. No EDD is provided with this data validation report.

Summary

No data quality outliers or technical deficiencies were identified that would require rejection of sample results. Missing Refractive Index (RI) Liquid Calibration required estimation of sample results.

Minor Problem

The RI Liquid Calibration was not included in the data package. Visual Estimation and Point Count Limits of Quantification (LOQs) are estimated and have been qualified "UJ".

Notes

Mill preparation can reduce fiber size. While allowable to homogenize samples under the method, care must be taken to discontinue as soon as the material appears homogenous. This cannot be evaluated through the data package. No data were qualified based on this finding.

Asbestos fibers classified as chrysotile by the laboratory were detected in trace amounts in visual estimation of sample SS-12. The result for this sample was below the LOQ in point counting.

Data for field duplicate pairs SS-03/SS-04 and SS-13/SS-14 were comparable. No asbestos fibers were detected in either analysis.

For the laboratory duplicate analysis performed on sample SS-12, results were comparable (both results were below the LOQ in point counting). For the laboratory duplicate analyses performed on samples SS-01 and SS-07, no asbestos fibers were detected in any sample pair. No data were qualified based on laboratory precision.

Laboratory blanks associated with the samples in this SDG were free of asbestos.

Microscope alignment verification is present and shows proper alignment.

Reference sample analysis and fiber identification criteria for the visual examination trace results were reviewed by the validator and found to be accurate and consistent.

Glossary of Inorganic Data Qualifier Codes

Validation Qualifiers	In order of descending precedence. Only one of these qualifiers may apply to any result.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
UJ	The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
U	The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit
B	The result is presumed a blank contaminant. This qualifier is used for drinking water samples only.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.

Re: **Narrative: PLM EPA/600/R-93/116 with Milling Prep; EMSL Order: 042004637, Case #R35754**

Dear Gene:

On February 21, 2020, EMSL Analytical, Inc. in Cinnaminson, NJ received nineteen (19) soil samples for asbestos content analysis via PLM EPA/600/R-93/116 with milling. All samples were received via FedEx under Chain of Custody #3-022020-124148-0001 from Techlaw, Inc. The samples were received in good condition and were logged in following normal lab procedures.

PLM EPA/600/R-93/116 with Milling Prep

The samples were dried prior to being placed in the puck mill. The milled samples were analyzed via Polarized Light Microscopy (PLM) using the procedures from the PLM EPA 600/R-93/116 method. All data was reported on a percent asbestos basis. Per the EMSL SOP method, any sample having asbestos content (visual estimation) ranging from <1 to 10% was subject to a 400 point count. The limit of quantification for this method is <0.25

QC Performed

Two inter-analyst and one intra-analyst QC analyses were completed with acceptable results. Quality Control for this project was performed in compliance with EMSL's Quality Assurance Manual.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. In addition, I certify, that to the best of my knowledge and belief, the data as reported are true and accurate. Release of the data contained in this data package has been authorized by the Laboratory Manager or their designee, as verified by the following signature.

Monthly PLM Bulk QC Summary

Laboratory: EMSL04 **Report #** 1 **Month/Year:** Mar-20

	Date	Reference # xxxx	Sample #	Original Result Analyst	Original Result % Asb	QC Result Analyst	QC Result % Asb	Variance Original	Variance QC	Conclusion	Comment or CAR#
	Variance (Var)		The difference of the 2 results divided by the mean of the 2 results								

Acceptance Criteria

Inter-Analyst:	*The QC Passes when: -1 ≤ Var ≤ 1*
Intra-Analyst:	*The QC Passes when: |Var| ≤ 1*
Qualitative Failure:	*A Qualitative Failure occurs when the Original and QC Asbestos Types Do Not Match*
Warning:	*Warnings Occur when the Original and QC Results are within the variance limits (stated above), but the 2 results are on opposite sides of the >1% ACM definition.*

CALCULATIONS: P= (AP * 100)/TP

P = Percentage of Asbestos TP = Total number of non-empty Points

AP = number of Asbestos Points

NOTE: IF AP = 0 after completion of analysis and no asbestos was observed, Report "ND"

NOTE: IF AP = 0 after completion of analysis but asbestos was observed, Report "< Analytical Sensitivity"

7. NVLAP/AIHA Certifications

United States Department of Commerce
National Institute of Standards and Technology

Certificate of Accreditation to ISO/IEC 17025:2017

NVLAP LAB CODE: 101048-0

EMSL Analytical, Inc.

Cinnaminson, NJ

is accredited by the National Voluntary Laboratory Accreditation Program for specific services, listed on the Scope of Accreditation, for:

Asbestos Fiber Analysis

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communique dated January 2009).

2019-07-01 through 2020-06-30

Effective Dates

ASBESTOS FIBER ANALYSIS — NVLAP LAB CODE 101048-0

Bulk Asbestos Analysis

Code	*Description*
18/A01	EPA -- 40 CFR Appendix E to Subpart E of Part 763, Interim Method of the Determination of Asbestos in Bulk Insulation Samples
18/A03	EPA 600/R-93/116: Method for the Determination of Asbestos in Bulk Building Materials

Airborne Asbestos Analysis

Code	*Description*
18/A02	U.S. EPA's "Interim Transmission Electron Microscopy Analytical Methods-Mandatory and Nonmandatory-and Mandatory Section to Determine Completion of Response Actions" as found in 40 CFR, Part 763, Subpart E, Appendix A.

For the National Voluntary Laboratory Accreditation Program

Effective 2019-07-01 through 2020-06-30

AIHA Laboratory Accreditation Programs, LLC

acknowledges that

EMSL Analytical, Inc.

200 Route 130 North, Cinnaminson, NJ 08077

Laboratory ID: 100194

along with all premises from which key activities are performed, as listed above, has fulfilled the requirements of the AIHA Laboratory Accreditation Programs (AIHA-LAP), LLC accreditation to the ISO/IEC 17025:2005 international standard, *General Requirements for the Competence of Testing and Calibration Laboratories* in the following:

LABORATORY ACCREDITATION PROGRAMS

✓	**INDUSTRIAL HYGIENE**	Accreditation Expires: November 01, 2020
✓	**ENVIRONMENTAL LEAD**	Accreditation Expires: November 01, 2020
✓	**ENVIRONMENTAL MICROBIOLOGY**	Accreditation Expires: November 01, 2020
☐	**FOOD**	Accreditation Expires:
☐	**UNIQUE SCOPES**	Accreditation Expires:

Specific Field(s) of Testing (FoT)/Method(s) within each Accreditation Program for which the above named laboratory maintains accreditation is outlined on the attached **Scope of Accreditation**. Continued accreditation is contingent upon successful on-going compliance with ISO/IEC 17025:2005 and AIHA-LAP, LLC requirements. This certificate is not valid without the attached **Scope of Accreditation**. Please review the AIHA-LAP, LLC website (www.aihaaccreditedlabs.org) for the most current Scope.

Managing Director, AIHA Laboratory Accreditation Programs, LLC

Revision 17 – 09/11/2018

Date Issued: 11/30/2018

AIHA Laboratory Accreditation Programs, LLC
SCOPE OF ACCREDITATION

EMSL Analytical, Inc.
200 Route 130 North, Cinnaminson, NJ 08077

Laboratory ID: **100194**
Issue Date: 11/30/2018

The laboratory is approved for those specific field(s) of testing/methods listed in the table below. Clients are urged to verify the laboratory's current accreditation status for the particular field(s) of testing/Methods, since these can change due to proficiency status, suspension and/or withdrawal of accreditation.

Industrial Hygiene Laboratory Accreditation Program (IHLAP)

Initial Accreditation Date: 02/01/1989

IHLAP Scope Category	Field of Testing (FoT) (FoTs cover all relevant IH matrices)	Technology sub-type/ Detector	Published Reference Method/Title of In-house Method	Method Description or Analyte (*for internal methods only*)

EMSL ANALYTICAL, INC.

8. Customer Correspondence

Exhibit A - SCOPE OF WORK
Asbestos Analysis by PLM
TechLaw-Wheeling Project No. R35754

1. Laboratory will provide containers for the number of samples and matrices specified in the attached Exhibit B – RFQ Bid Sheet. The containers will be shipped to the TechLaw-Wheeling, WV office. The sampling is scheduled to be conducted on February 18-21, 2020. ***The sample containers must be shipped to arrive no later than February 17, 2020.***

2. The laboratory must be NVLAP certified.

3. The samples will be analyzed for asbestos by polarized light microscopy (PLM) using EPA 600/5/93/116 (or equivalent). Sample preparation will include milling similar to procedures in CARB 435; however, milling should be discontinued as soon as the material being milled appears homogeneous, in order to reduce the potential for mechanically reducing fiber size. This should be documented in the lab narrative report. The lab will perform a 400-point counting procedure (maximum of eight slides with 50 counts each to minimum of two slides with 200 counts each) to achieve a reporting limit for asbestos in soil at 0.25%, if feasible. Analytical results are to be reported below the reporting limit (RL) down to the method detection limit. The Target Analyte List (TAL) of asbestos fibers/materials is presented in **Attachment 1.**

4. **TAT:** Request 10 business days TAT for all Level II reports and 15 business days TAT for the Level IV (CLP-like) reports and electronic data deliverables (EDDs) in the National Asbestos Data Entry Spreadsheet (NADES) format.

5. **Data Deliverables:** Level II report, Level IV (CLP-Like) data package, and EDD (in NADES format). The Level IV data package should include documentation required for independent, third party data validation in accordance with *USEPA PLM VALIDATION PROCESS GUIDELINES For Asbestos Data Review,* OLEM Directive 9200.2-179, October 2016. **Attachment 2** provides the documentation that will be required in the Final/Level IV data package. The EDD will be in the NADES format.

6. **Sampling schedule:**

   The sampling is scheduled for February 18-21, 2020.

7. **Bid due date: Friday, February 7, 2020 at 1:00 p.m. EST.** Bids should be submitted electronically to Gene Nance at: gene.nance@techlawinc.com.

NOTE: ***Bid price should include cost of analysis, shipping fee (to Wheeling, WV), data package, and any other associated costs (e.g., waste disposal, taxes, etc.).***
